Loft Labs, which makes Kubernetes easily accessible to developers, has announced that vcluster, a first-of-its-kind virtual cluster technology for Kubernetes, is now freely available on GitHub. Companies can now launch lightweight, fast vclusters that are backed by a single Kubernetes cluster, which consolidates workloads, allows for resource sharing, and ultimately saves a lot of infrastructure cost.

Fabian Kramm, CTO of Loft Labs, said, “vcluster is the first actually working virtualisation technology for Kubernetes. There are other similar solutions being developed. However, vcluster is the only one that is already being used in production by a variety of companies. We have decided to open source it because the demand for a standalone vcluster technology is huge and there needs to be an open source and freely available solution.”

With Loft, any Kubernetes cluster becomes a self-service platform where engineers can create name spaces and virtual clusters whenever they need them. At the same time, Loft’s sleep mode and cluster sharing technologies help eliminate idle workloads and save cloud computing costs.

Loft is used by platform teams in enterprises to create internal Kubernetes platforms for developing cloud-native software, executing continuous integration/continuous delivery (CI/CD) pipelines, or running artificial intelligence (AI) and machine learning (ML) experiments. It is also used in production use cases, where IT teams use Loft’s virtual clusters to surpass the scalability limits of regular Kubernetes clusters and where companies need to provision full-blown demo environments or securely-isolated instances of their managed software products.

Enterprises are increasing their reliance on open source software: Percona survey

Enterprises have a deep appreciation for the value of open source software, with all of the 200 information technology (IT) decision makers in a recent survey saying that “using open source provides benefits for their organisation.” The survey was recently conducted by Vanson Bourne and sponsored by Percona. It said that over the past disruptive 12 months, the use of open source software increased by 79 per cent as reported by the respondents

Of the 200 respondents, 25 per cent were from medium-size enterprises with 500-999 employees and 75 per cent were from large enterprises with more than 1,000 employees. They came from a cross-section of industries and had knowledge of open source software.

Tech Mahindra acquires DigitalOnUs

Tech Mahindra has announced that it has acquired DigitalOnUs, a leading hybrid cloud and DevOps services provider, to augment hybrid-cloud offerings for enterprise customers globally. Tech Mahindra has acquired 100 per cent stake in the organisation to strengthen cloud-native development, hybrid cloud infrastructure and SRE (site reliability engineering) automation.

Vivek Agarwal, president-corporate development, BFSI and HLS, Tech Mahindra, said, “The acquisition of DigitalOnUs marks an important milestone in Tech Mahindra’s growth journey, and will further enhance our capability in cloud native engineering, and better equip us to develop cutting-edge digital solutions for our customers. Scaling up near shore delivery capability, with majority in Mexico and Canada will be critical to execute digital transformation programmes. We welcome the associates of DigitalOnUs into the Tech Mahindra family, and look forward to achieving great success together.”

“The strategic acquisition will further elevate Tech Mahindra’s position as a partner of choice for hybrid cloud digital transformation. It will provide end-to-end transformation and new-age capabilities including enterprise DevOps and cloud native development technologies. Tech Mahindra will leverage DigitalOnUs expertise to build multi-cloud platforms, modernise IT security and unlock the cloud operating model for enterprises to accelerate their cloud modernisation journey.” he added.
