

Loft Labs announces availability of jsPolicy

Loft Labs, which makes Kubernetes easily accessible to developers, has announced the availability of its latest open source project, jsPolicy. As a first-of-its-kind policy engine based on JavaScript, jsPolicy makes policies in Kubernetes clusters easier to manage and maintain, while also making them understandable and transparent.

Fabian Kramm, CTO of Loft Labs, said, “Policies are key to securing Kubernetes operations, especially in multi-tenant clusters. Until now, policy engines have used lesser known languages such as Rego, making it hard to use for writing policies at first and even harder to understand and maintain these policies a few months later. jsPolicy allows organisations to express their policies in JavaScript, one of the most popular programming languages with over 12 million developers using it worldwide.”

The JavaScript execution in jsPolicy is based on Google’s high-performance V8 engine, which is used in almost every modern browser and optimised for low memory use and fast execution. This makes jsPolicy not just easier to understand but also much faster than any other policy framework.

Large enterprise respondents were most likely to have moved databases and applications to cloud services. Just 15 per cent of large enterprises continue to have all their databases and applications running at their on-premises data centre, compared with 29 per cent of medium-size enterprises.

The transition to the cloud was accelerated by the worldwide pandemic and demand for flexible, fast, and reliable technology. The report said that it is likely increase in demand led to an increase in costs — 68 per cent of respondents say that cloud infrastructure has become more expensive in the past year.

When asked about the benefits of using open source, 63 per cent of respondents cited increased innovation, 58 per cent cited improved security, while 50 per cent said cost saving, and 21 per cent said avoiding vendor lock-in.

The survey also asked how public cloud providers can contribute back to open source. Fifty-nine per cent said by providing better security, 48 per cent said by encouraging open source collaboration, 43 per cent said by improving existing code quality, and 43 per cent said by enabling open source to run on their cloud.

Kiersten Gaffney joins Codefresh as VP marketing

Codefresh has announced that Kiersten Gaffney, a seasoned marketing executive for enterprise open source software companies, has been named VP marketing. She will drive Codefresh’s strategy, brand management, demand and lead generation, and overall planning and execution, guiding the team to meet the needs of the business now and in the future.

Gaffney said, “I’m thrilled to be joining Codefresh, a company committed to the open source community while also leading the charge on enterprise adoption of continuous delivery. Every software company must deploy faster if they want to stay competitive. Codefresh is the only solution that provides organisations everything necessary to auto test, deliver, and deploy code frequently and reliably at scale in a multi-cloud environment on Kubernetes.”

Gaffney joins Codefresh after serving as interim VP marketing and

marketing advisor for several cloud native enterprise open source companies. Before that she served as VP marketing for productboard, a product management system, and VP marketing for Buoyant, Inc. She also served as senior director, marketing for Mesosphere, a platform that runs Kubernetes and big data services at scale on any cloud.

Dan Garfield, Codefresh’s chief open source officer, said, “Kiersten is a powerhouse with more than 20 years’ experience marketing Kubernetes and open source solutions. She immediately made a positive impact when she joined us in an interim capacity, and it was obvious she was the right person to help Codefresh exceed our next level of customer engagement and revenue goals.”

The Fedora Project announces the general availability of Fedora Linux 34

The Fedora Project, a Red Hat, Inc. sponsored and community-driven open source collaboration, has announced the general availability of Fedora Linux 34, the latest version of the fully open source Fedora operating system. Fedora Linux 34 improves the overall user experience with key updates like GNOME 40. It provides
