

a foundation for new use cases, like edge computing, with improved support for hardware watchdogs for automated system recovery.

Btrfs transparent compression for more disk space on desktop variants of Fedora Linux helps to increase the life span of flash-based media by reducing write amplification for solid-state disks (SSDs). This compression will be essential for

increasing read and write performance of larger files, with the potential to speed up related workflows.

Fedora CoreOS is an automatically updating, minimal operating system for running containerised workloads more securely and at scale. It is available in three different streams.

The stable stream is

offered with changes only reaching that stream after spending a period of time in the testing stream. The next stream represents the future.

The project plans this to be used to experiment with new features and also test rebases of its platform on top of the next major version of Fedora. A rebase to Fedora Linux 34 has been in the testing stream during the beta period and is rolling out to the stable stream now, and the next stream will advance to future development based on Fedora's 'Rawhide' development branch.

## Technology Innovation Institute launches open source 'Qibo'

Technology Innovation Institute (TII) has announced that its Quantum Research Centre (QRC) has developed the first simulation version of 'Qibo', an open source quantum computing programming framework, in collaboration with researchers from around the world. The development follows a series of rapid announcements at TII since the first ATRC board meeting in August 2020.

Qibo is designed to support quantum algorithms across different computer systems, including support to hardware accelerators such as graphics processing units (GPUs) and multiple quantum devices. This makes Qibo easy to use for quantum programming and to accelerate research and applications. Written in programming languages such as Python and C/C++, Qibo is the entry point

for a full stack programming platform, able to run quantum algorithms across different quantum computers and simulators.

Qibo is a joint project by Quantum Research Centre; Qilimanjaro Quantum Tech, the Barcelona based

quantum computing company; and researchers at other global centres. TII's Quantum Research Centre team is led by chief researcher Prof José Ignacio

## Rapid7 acquires Velociraptor

Rapid7, Inc. has announced it has acquired Velociraptor, an open source technology and community used for endpoint monitoring, digital forensics, and incident response. Through this acquisition, Rapid7 will continue to build the Velociraptor community, and leverage its technology and insights to enhance Rapid7's incident response capabilities.

Richard Perkett, senior vice president of detection and response at Rapid7, said, "Rapid7 has a long track record of supporting open source projects that began when we acquired Metasploit in 2009, and that commitment and support continues today. We strongly believe that partnership with the open source community is one of the most important ways to move the security industry forward and make the digital world a safer place for everyone. We look forward to bringing our expertise in growing and nurturing open source communities to Velociraptor, while also enhancing our monitoring, digital forensics, and incident response capabilities for customers."

Velociraptor was developed for digital forensics and incident response (DFIR) professionals who need a powerful and efficient way to hunt for and monitor malicious activities across endpoints. Velociraptor's community-driven approach allows the collective wisdom of the DFIR community to be gathered in one place and made accessible to others.

Velociraptor founder, Mike Cohen, who will also join Rapid7, said, "This is an exciting time for Velociraptor and the DFIR community. Velociraptor will greatly benefit from the investment, experience, and resources Rapid7 can bring to this community and I look forward to leading Velociraptor through this next phase of its evolution."
