

Open Source Intelligence (OSINT) market to cross US\$ 20 billion by 2027

The open source intelligence market valuation will cross US\$ 20 billion by 2027 as per a report by Global Market Insights Inc. Increasing availability of open source data, coupled with rising cyber threats, terrorism, and other illegal practices, is likely to drive the industry's growth.

The data analytics segment is anticipated to grow at a CAGR of above 25 per cent from 2021 to 2027. Data analytics plays an important role for enterprise-level businesses to analyse a huge amount of structured and unstructured data, and resolve their business imperatives.

The private sector segment is projected to witness exponential growth over the forecast period, i.e., from 2021 to 2027. This is because multiple organisations have targeted social media as their key source for promotion of different products, advertising campaigns, and events as it is more effective than the traditional way of advertising and marketing, providing lucrative opportunities for the market. The deployment of social media analytics and text analytics is anticipated to create numerous opportunities for private sectors for business decisions.

North America is projected to grow significantly in the open source intelligence market with over a 22 per cent CAGR over the forecast period. The growth is attributed to the increasing adoption of open source intelligence tools by various government and non-government organisations to gain business insights. Several enterprises operating in the region are focusing on new product launches for open source intelligence technology solutions.

Latorre. The first release of Qibo was published in September 2020, with the final version set for launch within the next two years.

Prof José Ignacio Latorre said, "We are committed to innovation that transcends boundaries. The quantum advantage in computing will offer notable benefits to broader society, ranging from life sciences to artificial intelligence and finance."

DataStax announces availability of DataStax Astra in the Microsoft Azure Marketplace

DataStax has announced the availability of DataStax Astra, which it says is the industry's first serverless Database-as-a-Service (DBaaS) for Apache Cassandra running in the Microsoft Azure Marketplace. DataStax Astra builds on the Apache Cassandra open source database and is an open, serverless, multi-cloud, database-as-a-service (DBaaS).

The cost optimisation and operational benefits of Astra serverless can 'bend the curve' of escalating data costs, delivering total cost of ownership (TCO) savings of up to 76 per cent over non-serverless database workloads, as per a recent study by GigaOm.

Ed Anuff, chief product officer at DataStax, said, "Our overarching goal with Astra is to empower users to leverage the best capabilities of Cassandra, with the least amount of friction and expense. Astra on the Microsoft Azure Marketplace is a natural step in this journey as we help all enterprises fuel their digital transformation with a cloud-first strategy and realise 'true' cloud economics."

LogDNA expands template library for NGINX and Kubernetes

LogDNA has released new templates for DevOps teams using NGINX with Kubernetes. Configured specifically for the open source and NGINX Plus based versions of NGINX Ingress Controller, these templates ensure that developers can use best practices to quickly gain visibility into their Kubernetes Ingress logs. This allows them to create an end-to-end view of their data across all systems for easier monitoring and troubleshooting.

Peter Cho, vice president of product, LogDNA, said, "Kubernetes clusters produce a lot of data. This is good because more data means more visibility into the environment, but it's important that our customers have shortcuts to actionability that save them time. The NGINX Ingress Controller template can be set up in minutes, making it easy for users to quickly gain value from

our platform. They spend less time with manual configurations so they can get back to building features and products that benefit their businesses."

Container orchestration with Kubernetes has exploded in popularity over the past several years with more than 80 per cent of

enterprises using it in production. An Ingress controller is one of the most important components of a production-grade Kubernetes deployment, and a most widely used Ingress technology, NGINX provides developers with an easy-to-use and highly customisable solution. For these developers, LogDNA is a critical part of their observability stack, offering actionable visibility into Kubernetes clusters so that engineers aren't drowning in data that they can't use effectively.
