

Castr joins SRT alliance to expand open source development of SRT protocol

Castr Live Streaming Inc. has announced that it has joined the SRT Alliance, the open source initiative dedicated to overcoming the challenges of low-latency video streaming. The company added that it will integrate the SRT protocol into its platform, enabling the best viewing experience, secured content from contribution to distribution, and pristine video quality over unreliable networks.

Jesús (Suso) Carrillo, director SRT Alliance at Haivision, said, “With a world that’s moving quickly towards videos over any network, Castr is focused on offering top-tier livestreaming solutions for its customers. By adopting SRT and joining the SRT Alliance, Castr is taking its solutions to the next level.”

Govinda Sunil, CEO of Castr Live Streaming Inc., said, “Castr Live Streaming Inc. is honoured and humbled to join this industry initiative. We recently introduced the beta feature of streaming videos with the SRT protocol for the first time, and have received positive responses from our users. Becoming a member of the SRT Alliance gives us not only a resourceful portal to contribute our expertise but also the possibility to explore the latest technologies and integrate them into a wide array of video streaming use cases.”

AlmaLinux is a 1:1 binary fork of Red Hat Enterprise Linux (RHEL), backed with a US\$ 1 million annual sponsorship by CloudLinux, with support provided until at least 2029. It is being developed with collaboration from the Linux community via public repositories and packages. The company said that the GitHub page is also published and the finalised source code will be added once the stable release has been completed. An important tool released with the AlmaLinux beta is the bug tracker. CloudLinux will work closely with bug tickets to further develop AlmaLinux and deliver the stable release.

JFrog and Docker team up to combine the power of JFrog Artifactory and Docker Hub

JFrog Ltd has announced an agreement with Docker to provide developers unlimited (for SaaS users), high-performance premium access to quality and trusted application components on Docker Hub, in order to streamline developer

experience and scale the use of containers in the enterprise. The agreement also provides dedicated support mechanisms for mutual customers.

JFrog Artifactory, also known as the ‘Database of DevOps’, is a software package management solution used by thousands of customers to host and manage their software artifacts, container images, and Helm Charts. JFrog users often mirror container images hosted on Docker Hub. SaaS subscribers of JFrog’s DevOps platform (including those who use the free subscription offered on AWS, GCP, and Azure) will benefit from uninterrupted access to Docker Hub and Docker Official Images through JFrog Artifactory.

The partnership will see access to high-quality content in Docker Hub, including Docker Official Images and content from Docker Verified Publishers. It will also see an industry-best developer experience for building, sharing, and delivering cloud-native applications and dedicated channels to support mutual customers, according to the company.

Scott Johnston, CEO of Docker, said, “At Docker, our mission is to help developers bring their ideas to life by conquering the complexity of app development. The combination of Docker with the immensely popular JFrog Artifactory, which can scale with very large workloads, reduces friction for developers and gives them confidence in their application components, allowing them easy onboarding to a Docker subscription and more time to focus on building great apps. We are excited to work with JFrog on this initiative, and look forward to our continued partnership to enable high-velocity cloud-native application development for our joint customers.”

Infinite Devices and Scalytics announce strategic partnership

Infinite Devices has announced a strategic partnership with Scalytics, an open source ML/AI-ops platform and maintainer of Apache Wayang, to create Infinimesh, an open source AIoT platform. The combination of two leading open source platforms, will work to help organisations across numerous industries implement a scalable Kubernetes based IoT platform designed to capture real-time data with any cloud or hybrid environment. The Scalytics
