

Jetstack launches Jetstack Secure

Image Source: <https://www.jetstack.io>

Jetstack, a Kubernetes product and services provider and Venafi company, has announced the launch of Jetstack Secure, its flagship product that extends the core value of the cert-manager open source project. The company said that Jetstack Secure delivers protection and full visibility of machine identities to cloud native platform and security teams. This includes public trusted certificates for ingress TLS, as well as private certificates for intra-service mTLS with service mesh.

Jetstack Secure deploys easily using Kubernetes resources. It includes an open source agent, and is backed by a reliable and scalable SaaS managed by Jetstack. The full interface can be set up to run for free on a single cluster, and customers can upgrade for advanced multi-cluster and alerting capabilities.

Matt Bates, Jetstack CTO and co-founder, said, “We’ve seen first-hand from our work with customers that adopting cloud native technologies and modern microservices architecture very quickly leads to a significant growth of TLS certificates – from ingress TLS, to intra-service mTLS, Kubernetes webhooks and more. As infrastructure scales and clusters accumulate, a very high level of automation is needed to ensure certificates are consistent and kept up-to-date. Automating the certificates’ life cycle, to keep workloads protected, is the core value of cert-manager.”

He added, “With Jetstack Secure our customers can see a detailed view of each cluster and an instant visual status of all workload certificates, including their association with Kubernetes resources. Crucially, it will identify and help to mitigate issues that can cause operational or security risk.”

Open source intelligence (OSINT) market to reach US\$ 11.86 billion by 2026

The global open source intelligence market size can grow at a CAGR of 17.4 per cent during the forecast period (2020-2026) to reach US\$ 11.86 billion by 2026, as per a report by Market Research Future. The market stood at a little less than US\$ 3.83 billion in 2018.

Tetrade launches open source project ‘GetIstio’

Tetrade has launched GetIstio, an open source distribution of upstream Istio that makes it easier for users to deploy and upgrade validated Istio. The latest initiative from Tetrade serves three key purposes. These are: providing safe, vetted Istio distributions for both upstream and FIPS compliant versions – tested against AKS, EKS and GKE; offering an optional CLI that makes Istio easier to use; and building a community that brings together Istio and Envoy users and technology partners enriched by knowledge sharing and training.

Tetrade co-founder and CEO Varun Talwar said, “A service mesh implementation can be complex and we are making it simpler and accessible by building a rich knowledge base, free training and a forum for adopters to socialise with experts. Istio is one part of the mesh puzzle and the other part is Envoy Proxy. What’s good can always get better. Our bi-weekly community meetings aim to bring it all together with support from integrating technology partners.”

Jetstack CTO and co-founder Matt Bates said, “With the Istio community, we’re pleased to have developed ‘istio-csr,’ open source software to integrate Istio with cert-manager. This enables workload certificates to be issued from the wide array of certificate authorities and providers that cert-manager supports, including Venafi, Google Certificate Authority Service (CAS) and more. We look forward to collaborating with the GetIstio community to provide an easy and seamless integration, enabling operators and security teams to tap into cert-manager and secure the mesh from the get-go.”
