

Picking **Bluetooth-Powered Headphones** *within* ₹4000

This article lists some popular choices for Bluetooth-powered headphones that are priced within ₹ 4000, and will help you pick the right one for your home.

The technology world has already shown us the unlimited advantages of going wireless. Wireless headphones are one of the most popular innovations today. The flexibility of hands-free control and freedom from tangled wires in crowded vehicles is incomparable. Headphones can utilise technologies like Bluetooth or radio frequency (RF) to operate wirelessly. In this article we look at Bluetooth-powered in-ear headphones due to the extensive pervasiveness of the technology today. We have limited our choices to headphones that cost ₹ 4000 or less.

Features of Bluetooth headphones

Bluetooth is an integral feature of smartphones, making it one of the most used media to transmit data wirelessly. Bluetooth headphones work on the same principle. To put it simply, the source device, that is, smartphone, tablet or music system, transmits audio data digitally in the form of a low-power Bluetooth radio signal. The headphones house a Bluetooth module, whose receiver unit receives the signal. A small amplifier inside the headphones strengthens the received signal. The signal is decoded back into audio data and played through the ear

pieces. The headphones come with a battery pack to keep them running.

Bluetooth headphones can pair with a single source device at a time. This ensures no interference by other devices during signal transmission. Data is transmitted in a secured connection. Generally, Bluetooth pairing can operate within a range of 10m (30-feet) between the paired devices. The headphones feature various control buttons for easy and quick use, including volume control, connectivity, playlists and more.

Data shared over Bluetooth is usually compressed, which
