For tracking protection in Firefox, take the following steps:

1. Click the *Menu* button — the three horizontal lines in the upper-right-hand corner of the browser.

2. Choose *Options*.
3. Select *Privacy and Security*.
4. Open the *Tracking Protection* section.

Select the tracking protection you want. If you opt for it to be always on, it may affect the functioning of some regularly visited websites. To avoid these problems, you can choose to block the third-party cookies only.

You can also go to the *Cookies blocking* options directly by clicking on the *Content blocking* option in the *Settings* menu.

Take the following steps for tracking protection in Chrome:

1. Go to *Settings*.
2. Click on *Privacy and Security* in the *Advanced* section.
3. Click on *Content settings* -> *Cookies*.
4. Choose *Block third-party cookies*.

The 'Do not track' option: Chrome and Firefox have the *Do not track* option in the browser settings, which can be turned on to prevent the websites from collecting the browsing information. But this is not sufficient as most of the websites do not honour the request since they face no penalty for not doing so.

Choosing a browser and search engine

Chrome is the most used browser. Since it acts as the gateway to the Internet for those using Chrome, the amount of data collected by Google, about each user, is very large. Though it is used only to serve ads, the scope for misusing data and manipulating the user is huge.

Users can opt for the Mozilla Firefox browser, as it is open source and prevents dominance by one single company.

The DuckDuckGo search engine can be used instead of the Google search engine to prevent Google from collecting data about you. DuckDuckGo does not track users or collect user information, and maintains privacy. You can make it the default search engine in *Preferences*. Alternatively, you can select it from the list of search engines which appear when the search keyword is being typed.
