Figure 2: Gigya features by accessibility category

Figure 3: Janrain integration architecture

- Suitability for cloud adoption/migration
- Visualisation support for customer data management

Gigya provides unified access management (UAM), including solutions for mobile identity management and privileged access management. The Gigya solution includes federated SSO with SAML, and social media identity registration and linking.

Gigya provides the account API, REST API, data store API and social network identification API as part of its SDK for developers. Detailed documentation and API references are available at developers.gigya.com.

Gigya provides a data store that is a flexible, fully indexed dynamic schema based store for handling customer identification details. The data objects are in JSON format and are limited to a maximum of 512k. Querying the data store is possible using a SQL-like REST API called *ds.search* and the data model is returned as a JSON result set. Details on the usage of the data model, the data store and its API are available

at developers.gigya.com/display/GD/Data+Store.

The features offered by Gigya with respect to user data handling are categorised into Connect, Collect and Convert.

The advantages of choosing Gigya for your integration architecture are:

- Visualisation dashboard and reports
- Dynamic system or record schema
- Account management

The disadvantage of choosing Gigya for your integration architecture is that it is an out-of-the-box SaaS offering. Hence, it has no ready-made feature for SaaS integration, and users have to do manual integration.

Janrain

Janrain is one of the pioneering CIAM solutions with a unique combination of customer profile management and

marketing insights. It is the first CIAM solution that comes with universal integration of CIAM event data with security information and event management (SIEM) systems like IBM QRadar. Data breaches and fraudulent transactions are due to compromised user accounts. Janrain is a complete solution for handling and avoiding such malicious activities. It is now part of the Akamai cloud delivery platform.

When dealing with CIAM integration in an industry context, profile management may be influenced by a number of factors:

- The flexibility to adopt at runtime
- User notification
- Customisable and extensible

For effective profile management, one can choose the Janrain Identity Cloud solution. One of the key unique features of a Janrain solution is that it can prepare user notifications on malicious attacks and compromised user accounts using an integrated CIAM solution.

The Janrain solutions architecture is based on the following key principles:

- Flexibility to integrate a digital transformation solution
- Data governance
- Identity security

The advantages of choosing Janrain for your integration architecture are:

- Customer profile management
- REST API support
- Marketing insights

The disadvantage of choosing Janrain for your integration architecture is that dynamic schema is not supported.

Future articles in this series will cover more CIAM solutions along with their features, integration patterns, advantages and disadvantages – particularly their integration with digital transformation architecture. **END** 🐧
