

With financial support from the California Energy Commission, EPRI created this open source software in collaboration with industry leaders including California investor-owned utilities. Project participants include the Automation Research Group, Enphase Energy, SunSpec Alliance, QualityLogic and Xanthus Consulting.

“The open source software from EPRI demonstrated a convenient path to integrating communications, security infrastructure, and messaging support for certification requirements during our investigation,” said Raghu Belur, co-founder and chief products officer at Enphase Energy.

Belur added, “The Enphase team was able to quickly test the sample application and software on our software-defined inverter platform and found it to be a strong

foundation for developing DER technologies consistent with IEEE 2030.5.”

The software complies with the IEEE 2030.5 communications standards for DER as laid out in IEEE 1547 and California Electric Rule 21.

EPRI posted the software online for public access under the open source BSD 3-clause licence. This software can be freely downloaded to assist with interoperability.

## npm Inc. debuts managed code registry for businesses

npm Inc., the provider of open source JavaScript developer tools and the operator of the world’s largest software registry, has announced the launch of npm Enterprise – the first managed deployment of the npm registry designed to meet the collaboration, security and compliance needs of large organisations.

npm Enterprise offers a dedicated cloud-deployed registry to enable the publication and sharing of public packages without the risk of a shared system. Companies will get their own “companyname.npme.io” website with support for industry-standard SSO authentication to control developer access and other permissions.

In addition, developers will have the choice to publish private packages to their own company registry or make them open source for anyone to access. The solution integrates with the npm registry, placing the world’s largest collection of open source software at enterprise developers’ fingertips, the company has claimed.

“Approximately 100 per cent of the world’s enterprises acquire over 97 per cent of their JavaScript from the npm Public Registry, making the introduction of npm Enterprise essential for the professionalisation of JavaScript development,” said Bryan Bogenberger, CEO of npm Inc.

Bogenberger added, “With npm Enterprise, we are giving JavaScript developers the npm tools they love while providing the enterprise with enhanced visibility, security and control. The result: happiness throughout organisations everywhere.”

The company explained that in the past, enterprise developers were only able to share code with one another via email or an artefact store, which limited their ability to reuse and scale. With npm Enterprise, the company said, firms can benefit from a modern, open source development workflow that allows developers to work, while ensuring security, compliance and access control.

“We believe that npm Enterprise can help organisations build better software more quickly than ever before,” said Isaac Z. Schlueter, chief product officer at npm Inc.

## Redis Labs changes Modules licence once again

Redis Labs, the open source NoSQL database provider, has once again revised its licence structures for Redis Modules, following negative responses from its partners over the Commons Clause licensing model.

The company has now changed the licence of its Redis Modules from Apache2 modified with Commons Clause to the Redis Source Available License (RSAL).

Last year, Redis Labs landed in a controversy after it shifted to a Commons Clause licensing model, apparently to protect its software from being used by cloud providers for their own commercial benefit.

The company changed the licence of its Redis Modules from AGPL to Apache2 modified with Commons Clause. This led to some confusion in the open source community, with some even assuming that the Redis Core had been made proprietary.

After Redis Labs, MongoDB created the Server Side Public License for its open source software (the licence is under review by the OSI), and Confluent announced the Confluent Community License.

Redis Labs said it decided to change the licence of its Redis Modules to Redis Source Available License (RSAL) after receiving feedback from multiple users, who wanted the company to improve its licence to favour developers’ needs.

“RSAL grants equivalent rights to permissive open source licences for the vast majority of users. With RSAL, developers can use the software, modify the source code, integrate it with an application, as well as use, distribute or sell their application. The app’s one restriction is that it cannot be a DB, a caching/stream processing/search or indexing engine nor an ML/DL/AI serving engine,” the company states.
