

projects to peers, either in person or over email.

At Red Hat, we look for people who are open to learning new things and willing to use that learning in a manner that is beneficial to the community, because that is the open source way.

Q. Could you tell us briefly about the academic partnership programmes conducted by Red Hat and what are some of the certifications you offer?

A. Open source solutions are core to innovation in areas like cloud computing, containers, mobile, AI, ML and beyond. By bringing the Red Hat Academy as well as training on Red Hat's open source solutions to students, Red Hat and our partner institutions/universities are aiming to equip a future workforce in India with in-demand skills.

At Red Hat, we strongly believe in the power of participation and innovation through collaboration. We really value our community, and these partnerships help us train individuals and inculcate in them our organisation's DNA. In the long run, this helps us with a readily available talent pool familiar with the Red Hat solutions and services. The training allows the young students and budding developers to be fully equipped to deal with open source concerns. Red Hat focuses on training delivery through several means including the brick and mortar instructor-led classroom model, instructor-led virtual training, self-paced online learning and video classrooms. Red Hat Learning Subscription, which encompasses the self-paced online learning with video classrooms, virtual labs and a year-long access to content, videos and 400 hours of practice in labs is considered a phenomenal method of learning.

Red Hat Academy's core curriculum consists of systems administration and systems engineering on Red Hat Enterprise Linux, besides Red Hat JBoss middleware administration and introductory Red Hat OpenStack (cloud) content. Red Hat provides technical training in these areas to the Red Hat Academy faculty at institutions participating in the Academy Programme. These courses are global and are provided in 35 locations across North America and 85 locations worldwide with the same content and quality, no matter where one is. The instructors are deployed through Red Hat Certified Training Partners for these courses, and are all experienced Red Hat Certified Professionals who are intimately familiar with the course curriculum (<https://www.redhat.com/en/services/training/red-hat-academy>).

“We firmly believe open source unlocks the world's potential. Even our customers value the open source ethos of transparency, community and collaboration.”

Q. Over the years, what have you learnt about motivating young engineers?

A. Young engineers today are at the brink of emerging tech and open source, and should take their time to understand these current trends in the associated spaces. It is also important for senior leaders to guide them and help them figure out where they should place their skills. Additionally, including people in key product and management

decisions makes them feel valued. Being involved in the design and planning process pushes them to create higher quality products. It is also absolutely essential to ensure that while working with young energetic engineers, plans are not only realistic in terms of being executable but also challenging enough to keep them motivated to excel.

Q. What is Red Hat's roadmap to drive open source innovation?

A. We firmly believe open source unlocks the world's potential. Even our customers value the open source ethos of transparency, community and collaboration, and we help them benefit from the innovation of open source-developed software. Through the Red Hat Open Innovation Labs, we are bringing this knowledge and experience directly to our customers. The lab can be used in a residency-style, virtual or pop-up setting, where Red Hat consultants, engineers and subject matter experts collaborate and work closely with customers to modernise existing applications or create new ones with open source and DevOps. We drive open source innovation not just among enterprises but within the developer community too.

Our Red Hat Developer Programme (<https://developers.redhat.com/>) is built for developers, by developers. It provides access to software, tools, guides and resources to make their job and daily work easier. With Red Hat Enterprise Linux and Red Hat JBoss Middleware available through the programme at no cost, developers can more easily use our technology to start projects and explore solutions, while having the confidence that their chosen development platforms and tools can be supported in production, without porting or incompatibility issues. **END** 🐧
