

Intercept X for Server

Designed to secure business critical servers, VMs, and cloud workloads (for both AWS and Microsoft Azure) without sacrificing performance, Intercept X for Server protects against malicious attacks. It leverages powerful technologies to keep servers safe, including: the ability to detect never-before-seen malware using deep learning; block ransomware and roll back affected files; block hacking attempts leveraging the most-used exploit techniques; plus root cause analysis capabilities to help admins better understand how an attack occurred, what its impact was, and how to prevent it from happening again. Intercept X for Server also includes Server Lockdown for application whitelisting, and allows comprehensive discovery and protection of cloud workloads.

Provides server security through the following features:

- Deep Learning Malware Detection
- Server Lockdown
- Signatureless Exploit Prevention
- Server Application Aware
- Active Hacker Mitigations
- Synchronized Security
- Ransomware and Master Boot Record Protection
- Flexible Deployment Options
- Root Cause Analysis
- Cloud Workload Discovery and Protection (AWS and Microsoft Azure)
