

A Guide to Publishing Your First API in WSO2 API Manager

This article explains in brief how to create a Hello World API in Python, and publish it on the WSO2 API Manager. It is intended for first-time users of WSO2 API Manager and those who are new to the REST API.

WSO2 API Manager is an open source tool that supports complete API life cycle management. It provides support for creating, publishing, monitoring and managing APIs. An API Manager (APIM) provides various features for providing security, versioning, publishing, monitoring, life cycle management, governance, etc, for the APIs. APIM is available on multiple platforms like AWS Cloud Formation, Kubernetes, Docker, Docker Compose, Vagrant, Helm, CentOS, Mac OS, Ubuntu, Windows, etc.

This article is divided into two parts, the first of which explains how to create a Hello World API and then host it using the Flask server. The second part covers the essential steps for setting up the API manager to publish and access the APIs.

Setting up the Hello World API on Flask

The API (Hello World) to be published using APIM is set up on a Flask server.

The API returns 'Helloooo World!' text on the GET request.

- 1) Install Python from <https://www.python.org/downloads/windows/>.
- 2) Install the Flask server using the command `pip install Flask`.
- 3) Create a 'Hello World' program in a normal editor like Notepad or Python IDEs like PyCharm with the following code:

```
from flask import Flask
app = Flask(__name__)
app.config["DEBUG"] = True
@app.route('/hello', methods=['GET'])
def hello():
    return 'Helloooo World!'
if __name__ == "__main__":
    app.run()
```

- 4) Save the above code as `hello.py`. The program can be executed using the command `python hello.py`. The following messages are displayed in the terminal when you run the program:

```
* Serving Flask app "hello" (lazy
```

```
loading)
```

```
* Environment: production
  WARNING: Do not use the development
server in a production environment.
  Use a production WSGI server
instead.
* Debug mode: on
* Restarting with stat
* Debugger is active!
* Debugger PIN: 301-321-685
* Running on http://127.0.0.1:5000/
(Press CTRL+C to quit)
```

- 5) Access `localhost:5000/hello` using a browser and your 'Hello World' application is ready.

Setting up the API Manager (APIM)

WSO2 APIM can be downloaded from <https://wso2.com/api-management/install/>. For this article, APIM has been installed on Windows with a single node deployment. Before running APIM, you need to install Java and set the `JAVA_HOME` environment variable.
