Publishing the 'Hello World' API using APIM

APIM's 'Publisher' publishes APIs, provides documentation, etc. The API Publisher URL is `https://<IPAddress or hostname>:9443/publisher`. The default credentials are `admin/admin`. You need to access the Publisher URL to publish the Hello World API. Figure 1 shows the page when no other API is published on APIM. The page allows you to add a new API.

The steps for publishing a new API are as follows.

- 1) Select 'ADD NEW API' to start publishing the first API, as shown in Figure 1.
- 2) Select 'Design a New REST API' to add a new API.
- 3) You will get a *Design API* page, where you need to enter the general details of the API to be published like the name, context, version, etc. The context is the path in the URL that will be used to access the API. Access control and visibility of the API can be controlled by adding the appropriate values.
- 4) Next, define the API details like the URL pattern and resources. Note that the context and the version data given in the 'General Details'
