

Applications

An application is a logical collection of APIs. Applications allow you to use a single access token to invoke a collection of APIs and to subscribe to one API multiple times with different SLA levels. The DefaultApplication is pre-created and allows unlimited access by default.

Add Application

An application is a logical collection of APIs. Applications allow you to use a single access token to invoke a collection of APIs and to subscribe to one API multiple times with different SLA levels. The DefaultApplication is pre-created and allows unlimited access by default.

Name*

Characters left: 63

Per Token Quota
Allows unlimited requests

This feature allows you to assign an API request quota per access token. The allocated quota will be shared among all the subscribed APIs of the application.

No Subscriptions

This application has not yet been subscribed to an API. To subscribe, select an API from [API listing page](#) and subscribe to it with an app.

Figure 6: TestApp application page of WS02 API Store

section is already reflected in the URL pattern. For the Hello World API, the resource can be selected as GET and the resource path can be given as '/'. Select 'Add' after entering the details.

- Click on GET/ to add details of the API like the parameters, content

type, etc. Select *Implement* to add the URL details of the Hello World API to be published.

- Select *Endpoint Type* as HTTP/REST Endpoint. Provide the production endpoint as `http://localhost:5000/hello`, the URL that is used to access the API endpoint on Flask. Click *Test*

to check whether the APIM is able to access the URL. If *Test* is successful, then we will get the following output in the Flask server:

```
127.0.0.1 - - [26/Mar/2019 18:55:26]
"HEAD /hello HTTP/1.1" 200 -
```

- APIM will show the endpoint as 'valid' as shown in Figure 2.
- Select *Manage* to provide details of API throttling, configurations, subscription tiers, etc.
- Select *Save & Publish* to publish the API.
- When the API is published successfully, the publisher will list the details as shown in Figure 3. The published API can be viewed in the API Store.

Get access to the Hello World API from APIM

APIs can be discovered and subscribed from the API Store, the URL for which is `https://<IPAddress or hostname>:9443/store`. The default credentials are `admin/admin`.

Create applications in APIM

APIs can be accessed using subscriptions against an 'Application'. An application is a logical collection of APIs. Applications allow you to use a single access token to invoke a collection of APIs and to subscribe to one API multiple times with different SLA levels. The *DefaultApplication* is pre-created and allows unlimited access, by default.
