

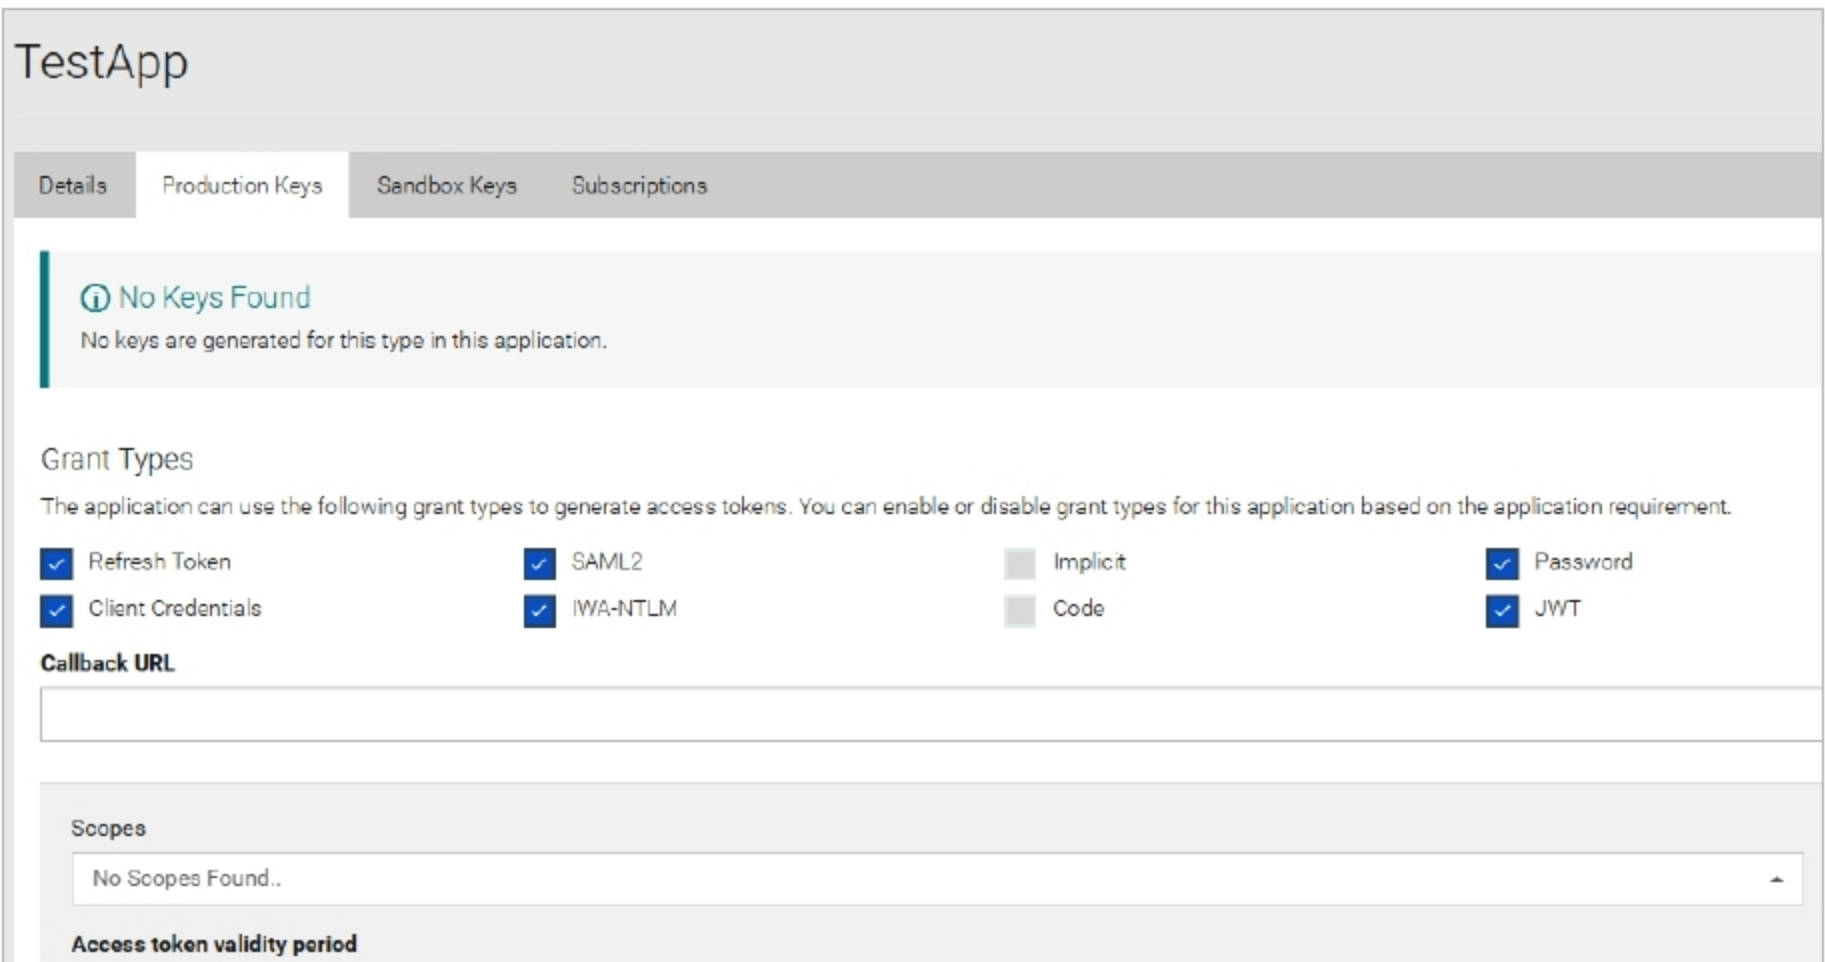

Figure 7: Production key list page of the *TestApp* application

Follow Steps 1 and 2 to add a new application to an API from Store.

- 1) Select *Applications* from the left-hand side of the page. It will display the list of applications.
- 2) Select *Add Application* to add a new application. Enter the details of the application like the name and description, and then select the Token Type (OAuth and JWT) to be used for authentication, and the API request quota per access token. Select *Add* to add the new application. The new application's 'TestApp' gets added to the list of applications available.
- 3) Select *TestApp* from the applications list and go to *Subscriptions*. As you can see, there are no subscriptions for the new application created.

Before subscribing to APIs, an access token/key has to be generated once for every application. This access token needs to be present with every request sent to APIM to access the subscribed API. The APIM checks the token value before allowing access to the API.

- 4) Go to *Production Keys* to generate keys. As you can see in Figure 7, no keys have been generated till now for this application. Select *Generate Keys*.

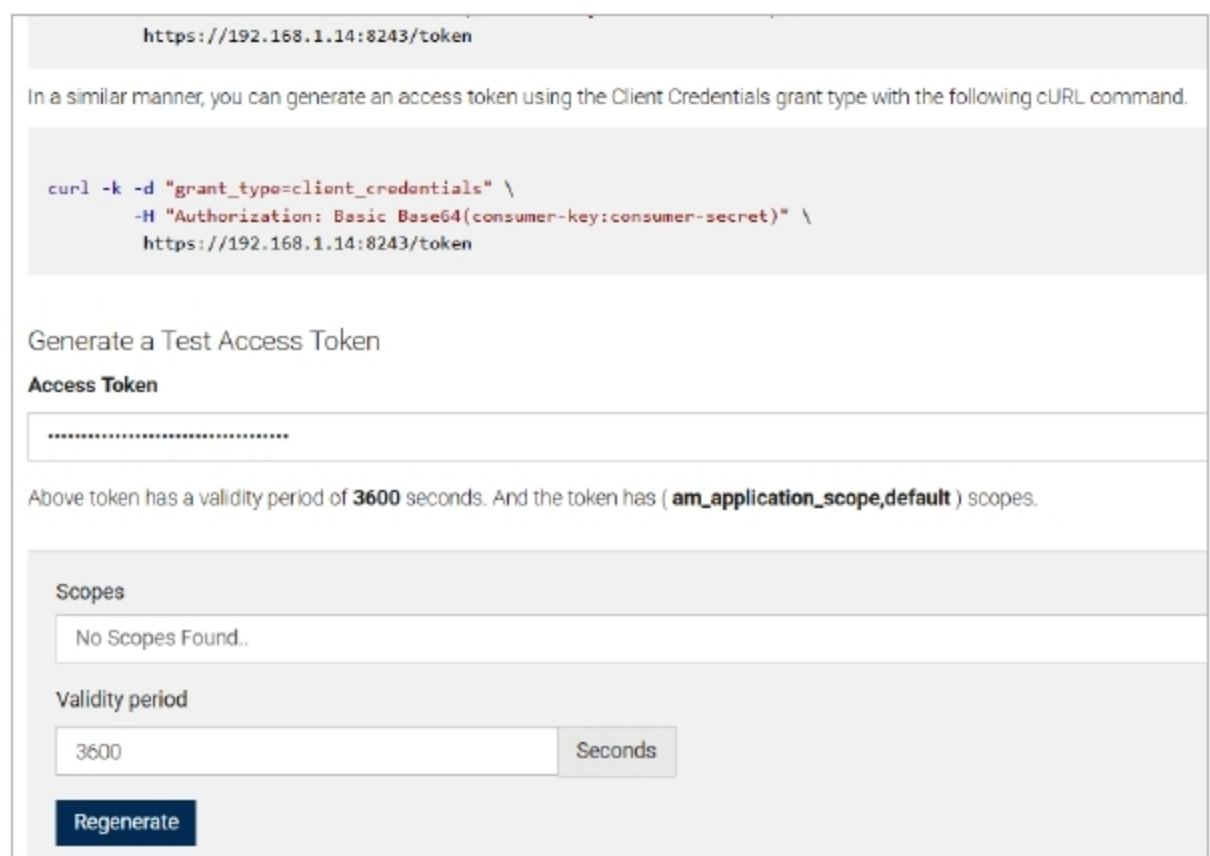

Figure 8: Access token generated for the *TestApp* application

- 5) Keys will be generated as shown in Figure 8. The access token generated needs to be used in the 'Authorization : Bearer' of the Request Header. The keys generated have a validity period as mentioned in the *Validity Period*. The key has to be regenerated once the validity is over. The validity period can be changed as per the requirements.

Subscribe to an API from API Store

Now that you have created an application and access token, you can start subscribing to the Hello World API.

- 1) Select 'APIS' from the left-hand side of the page. It will display the list of APIs available. Select the *Hello World* API. The API details will be displayed as shown
