

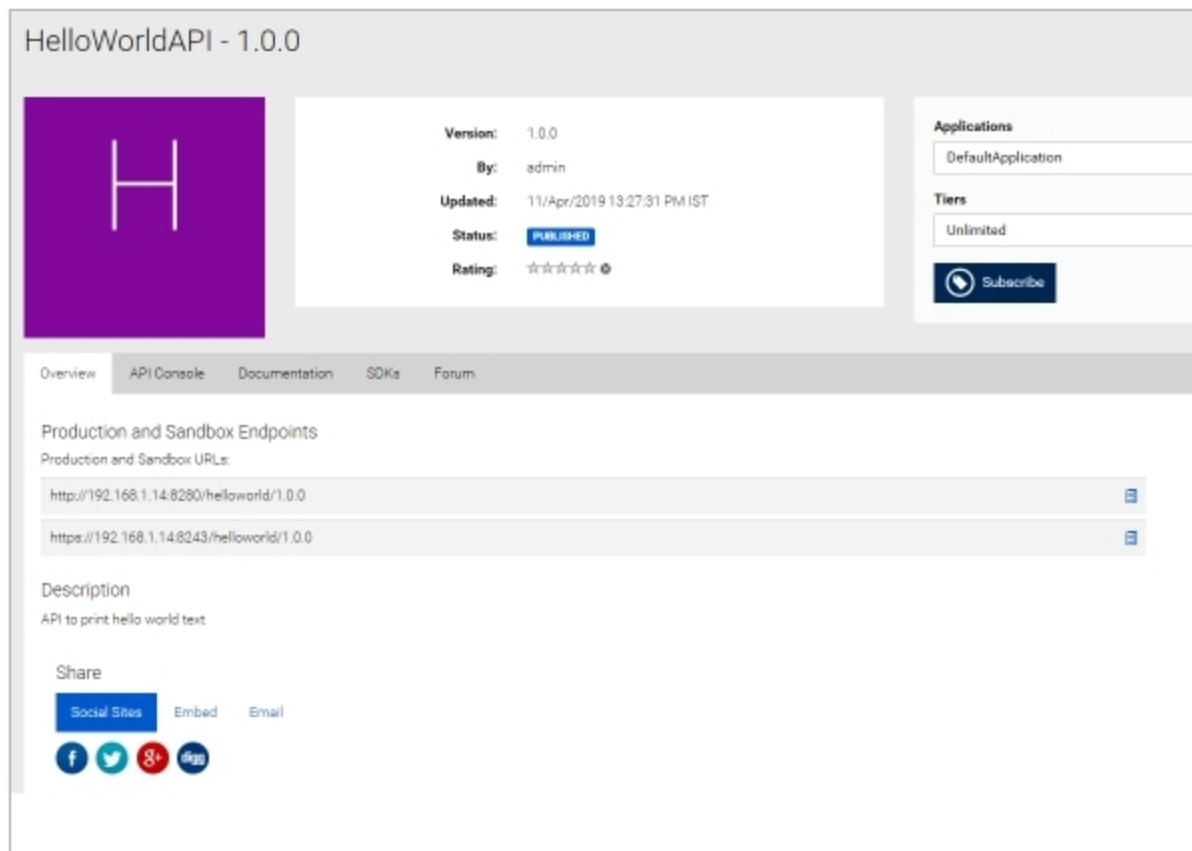

Figure 9: Hello World API in WS02 API Store

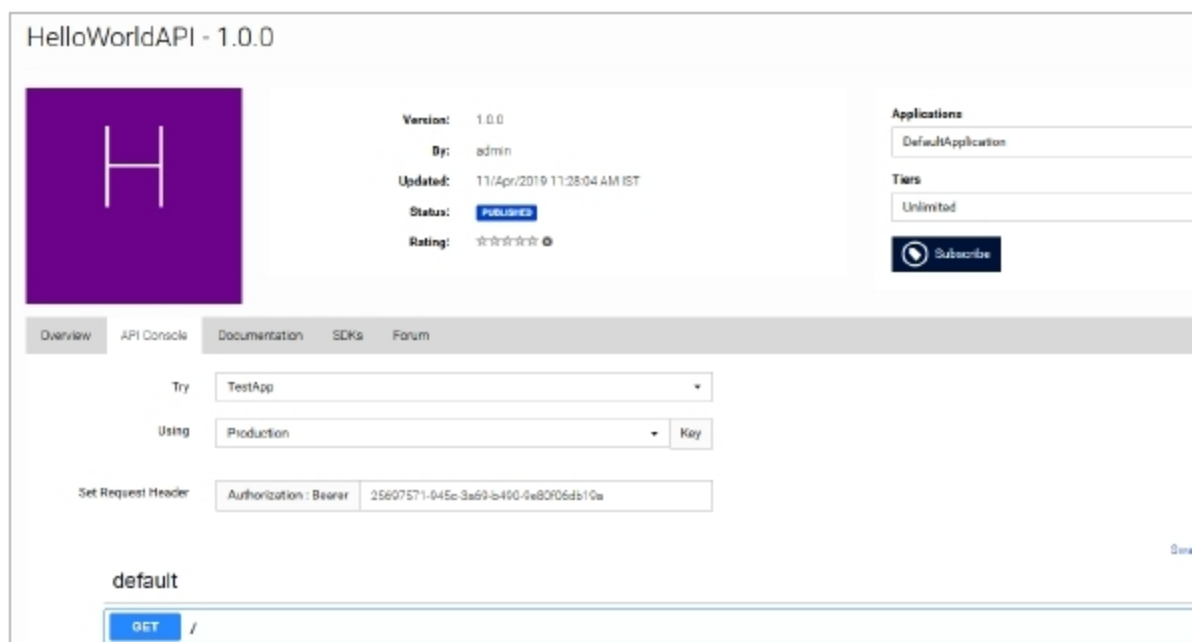

Figure 10: Hello World API endpoints in WS02 API Store

in Figure 9. The URLs used to access the APIs through APIM are listed in the 'Overview' section. Http URL is `http://<ip-address/hostname>:8280/helloworld/1.0.0`. Https URL is `https://<ip-address/hostname>:8243/helloworld/1.0.0`.

- 2) Select *TestApp* from the applications list in the top right corner of the page and click on *Subscribe*. Go to the *API Console Tab* and you can see the access token getting automatically reflected against the authentication part.
- 3) The API can be accessed via the cURL command as given below:

```
curl -k -X GET "http://<ip-address/hostname>:8280/helloworld/1.0.0" -H
```

```
"accept: text" -H "Authorization: Bearer 25697571-945c-3a69-b490-9e80f06db19a"
```

- 4) You will get the following message in the Flask terminal:

```
127.0.0.1 - - [26/Mar/2019 18:55:26]
"GET /hello HTTP/1.1" 200 -
```

- 5) You can also access the API using the Python code given below. For this code to work, you need to install the Python requests library by using the command *pip install requests*.

```
url = 'http://192.168.1.14:8280/helloworld/1.0.0'
header = {'Authorization': 'Bearer 25697571-945c-3a69-b490-9e80f06db19a'}
response = requests.get(url, headers=header)
print("Response code: " + str(response.status_code))
print("content: " + str(response.text))
```

This article introduces beginners in REST API and API gateways to how to add a REST API to an API gateway. The latter can be used to host organisational or community APIs in the respective cloud environment. It helps in the reuse, adoption and faster acquisition of developed cloud services. **END** 🐧
