

Ethereum: Look Out for this Secure Cryptocurrency

Ethereum is the foundation for a new era of the Internet. According to its website, Ethereum will enable an Internet where money and payments are built in; an Internet where users can own their data, and your apps don't spy and steal from you; an Internet where everyone has access to an open financial system; and an Internet built on neutral, open-access infrastructure, controlled by no one company or person.

Everybody wants their money to be more secure and smart, and cryptocurrencies can ensure this in the most foolproof manner currently known. But risks and rewards are intrinsically linked, particularly in the case of the cryptocurrency market. Cryptocurrencies provide dynamically scalable and virtualised resources as services over the Internet. With the assistance of this technology, people can perform several functions, including financial transactions. Ethereum, as a technology, is a powerful tool to combat the issue of spam and hacking,

to protect user information as well as secure the cryptocurrency market. This solution, which is based on the Merkle Patricia Tree, enables enterprises to work more efficiently and stops the spread of fraudulent financial transactions.

Ethereum - an introduction

Ethereum is an open source, public, blockchain based distributed computing platform and operating system that enables smart contracts. Ether is a token, the blockchain for which is generated by the Ethereum platform.

Ether can be transferred between accounts and used to compensate participant mining nodes for the computations performed.

Ethereum provides a decentralised virtual machine, the Ethereum Virtual Machine (EVM), which can execute scripts using an international network of public nodes.

Ethereum was developed in late 2013 by Vitalik Buterin, a cryptocurrency researcher and programmer. The word Ethereum is based on the word 'ether', which refers to a hypothetical, invisible medium that
