

SUSE Enterprise Storage 6 helps reduce IT operational expenses and accelerates innovation

Sources at SUSE say the latest release of its software-defined storage solution will enable IT organisations to seamlessly adapt to changing business demands while reducing IT operational expenses.

SUSE Enterprise Storage 6, powered by Ceph technology, boasts of new features focused on containerised and cloud workload support, improved integration with the public cloud and enhanced data protection capabilities.

“SUSE is powering digital transformation with agile open source solutions like Enterprise Storage 6. It therefore enables enterprises to continually innovate, compete and grow,” said Brent Schroeder, CTO, Americas, for SUSE.

“We aim to transform enterprise storage infrastructure with an open and intelligent software-defined storage solution. Furthermore, we want it to reduce costs and alleviate proprietary hardware lock-in for customers. Enterprise Storage 6 reflects SUSE’s ongoing commitment to making Ceph ‘enterprise consumable’,” Schroeder added.

According to SUSE, Enterprise Storage 6 allows IT organisations to seamlessly adapt to changing business demands by:

- Accelerating innovation. It removes storage silos, giving organisations easier access to different types of data and enabling them to quickly extract information from it using cutting-edge search and analytics tools.
- Maximising application availability. It enables faster and more granular backups that can now leverage low-cost public cloud resources for improved data protection.
- Responding to changing business demands faster. It also gives organisations the ability to easily leverage public cloud resources as part of their storage infrastructure.

These include hosting consulting services, infrastructure hosting, virtual machine (VM) hosting, dedicated server hosting, Virtualmin hosting, monitoring hosting, backups hosting, Web hosting, WordPress hosting, Drupal hosting, email and other custom hosting services.

“Although LinuxForce has offered hosting services for more than 15 years, previously we focused on our systems administration and clustered services. We have now reorganised these capabilities as a new suite of hosting services,” said LinuxForce president and CEO, C.J. Fearnley.

Fearnley continued, “Systems administration services has been our main business. Systems administration is effectively hosting, but now these capabilities are articulated in the terms the market has come to think of them—as commonplace hosting services.”

LinuxForce Hosting Services consist of hosting consulting services and Infrastructure-as-a-Service (IaaS) generally built on top of LinuxForce Cluster Services and managed with Remote Responder Services.

According to the company, these services can help organisations understand which hosting configuration makes sense for them.

Fearnley explained, “Over the past few years, we’ve noticed that many of the loss-leader hosting companies have either gone away or transitioned to a more sustainable pricing model. These market changes create a unique position for our Remote Responder Services and our experience deploying services at customer premises, in the cloud, and on our Cluster Services platform. This is the reason we have repackaged our services under the hosting rubric. Now our capabilities can be understood in terms the market better understands.”

The company has described its offerings on a new Web page called LinuxForce Hosting Services.

IT transformation becomes more cost-effective and secure with SUSE Manager 4

SUSE has come up with two new tools to help enterprises better manage their software-defined infrastructure—the SUSE Manager 4 and SUSE Manager for Retail 4 open source infrastructure management solutions.

These tools are designed to help enterprise DevOps and IT operations teams reduce complexity and regain control of IT assets,
