

increase efficiency while meeting security policies, and optimise operations via automation to reduce costs, the company said.

“As SUSE helps enterprise customers transform to software-defined infrastructure so they can continue to innovate, compete and grow in today’s markets, we also provide the tools they need to efficiently manage and operate their mixed environments,” said Daniel Nelson, SUSE vice president of products and solutions.

“SUSE Manager manages physical, virtual and containerised systems across edge, core and cloud environments, all from a single centralised console. It is part of the IT transformation that lowers costs, reduces complexity and boosts business agility,” Nelson added.

As a key component of a software-defined infrastructure, SUSE Manager 4 allows enterprises to:

- Reduce costs and simplify management with enhanced content life cycle management that makes it easier to move and manage packages throughout the DevOps cycle. Salt-based virtual machine management allows near real-time management of hundreds of servers.
- Increase availability and visibility with expanded monitoring and alerting capabilities built on the next-generation Prometheus based monitoring stack. This enables customers to easily identify and resolve issues.
- Reduce complexity and regain control of complex heterogeneous IT environments with expanded operating system support and new SAP HANA deployment capabilities. This make it easier than ever to install and configure SAP HANA.

Tailored specifically for the retail industry, SUSE Manager for Retail helps reduce costs, optimise operations and ensure compliance across retail IT infrastructure.

Wind River is the first software company to become OpenChain 2.0 compliant

Wind River, a global leader in delivering IoT software for critical infrastructure, is now certified on OpenChain version 2.0. It was also the first company to become OpenChain compliant.

Hosted by the Linux Foundation, the OpenChain Project aims to build trust in

open source by making open source licence compliance simpler and more consistent.

Companies with OpenChain conformance

deliver open source artefacts that are prepared by using a comprehensive and disciplined program. The certification helps a company further build its reputation and trust by reinforcing that the provided artefacts are of high quality.

“OpenChain conformance is gaining traction as the industry standard for open source compliance in the supply chain. OpenChain certification for open source licence compliance and usage ensures that one can trust the open source from which software solutions are built,” said Michel Genard, vice president of product, Wind River.

“We greatly value our close relationship with the OpenChain Project, and believe it is vital to lead by example and uphold strong standards for open source compliance,” Genard added.

Wind River is committed to supporting and deploying important standards for open source compliance. The company claims it “maintains OpenChain conformance across its product lines, including Wind River Linux.”

Wind River Linux is freely downloadable. Additionally, Wind River offers
