

TIPS & TRICKS

Display all details about your system in the terminal using Neofetch

Neofetch is a command line based system information tool written in bash. It displays information about your system next to the logo of your OS. The main purpose of Neofetch is to be used in screenshots to show other users what distro you're running, what themes/icons you're using, etc.

To install it, use the following commands:

```
$ sudo add-apt-repository ppa:dawidd0811/neofetch
$ sudo apt update
$ sudo apt install neofetch
```

How to get the hardware specs

Many Linux users want to know the hardware specifications of their systems, for which they need to open the terminal and use the following command:

```
$ sudo lshw
```

Shown below is a snipped part of the output of the command for the display unit:

```
*-display
      description: VGA compatible controller
      product: Broadwell-U Integrated Graphics
      vendor: Intel Corporation
      physical id: 2
      bus info: pci@0000:00:02.0
      version: 09
      width: 64 bits
      clock: 33MHz
      capabilities: vga_controller bus_master cap_
list rom
```

```
configuration: driver=i915 latency=0
resources: irq:45 memory:d2000000-d2ffffff
memory:c0000000-cfffffff ioport:7000(size=64) memory:c0000-
dffff
```

Likewise, the full output will show details about the CPU, Wi-Fi router, hard disk, etc.

Run multiple commands with sudo privileges

To run multiple commands with sudo privileges, use the '<shell name> -c' option with sudo.

Here is an example that shows you how to use multiple commands to update and upgrade the installed packages on Debian/Ubuntu systems:

```
$ sudo bash -c " apt update && apt upgrade "
```

How to log in to the server without a password by using SSH

If you want to remotely log in to a server, then the SSH server needs to authenticate the user for remote access, for which you have to enter the password of that user. If you have to connect very often, it might get annoying having to enter the password on every attempt to connect to the server.

So if you ever wondered if there was any way to log in to your server without entering a password, you'll be glad to know, there is a way!

Here is how it can be done. Passwordless login still requires authentication in the form of an SSH key. This is in fact a set of two keys, known as a key-pair, which consists of a public key and a private key. The former is copied to the server while the private key stays on the
