

for multiple messaging platforms like Slack, Telegram, Microsoft Bot Framework, Nexmo, HipChat, Facebook Messenger, WeChat, and many more. It supports advanced features like middleware systems, NLP, and user information storage and retrieval.

BotMan provides built-in support for the api.ai NLP service. BotMan Studio—a packaged BotMan and Laravel application—provides testing tools, an out-of-the-box Web driver implementation, and additional tools like easier driver installation and configuration support. BotMan Studio can speed up development by providing a Web driver implementation, which allows you to develop your chatbot locally and interact with it through a simple Vue.js chat widget. This lets you communicate with your bot without deploying it.

Core features

- Support for Facebook, Telegram,

Slack and other messaging apps to send file and audio attachments

- Support for Kik and Facebook Referral driver
- Support for developers to create customised middleware

Latest version: 2.0

VEISO Bot Maker

VEISO Bot Maker is primarily a visual interface that allows users to design drag-and-drop conversations. It also connects to multiple messaging channels, including Facebook Messenger, Slack, Kik, Skype, Telegram, WeChat, Google Home/Assistant, Amazon Alexa, and Microsoft Cortana. It combines artificial intelligence, natural language processing, automatic translation, language detection, and computer vision, and also connects to enterprise core information systems, such as those for customer relationship management (CRM) and enterprise resource planning (ERP).

VEISO Bot Maker provides a wrapper of the MS Bot Framework, which handles up to 12 different channels including Facebook, Skype and Slack. It provides an open API to connect custom channels.

The bot wrapper can build a message from input data and then handle the response from the message nodes.

The dialogue flow (aka API.ai server) node is an implementation of the bot wrapper dedicated to the dialogue flow (and so Google Home).

The WeChat node is an implementation of the bot wrapper dedicated to WeChat.

This open source platform provides lots of nodes to manipulate and design conversations.

- Speech recognition tools like Bing Speech and Google Speech use AI to convert audio buffer to raw text.
- Natural language processors (NLP/NLU) like DialogFlow and LUIS use AI to convert raw text into
