

intents and entities.

- Computer vision systems like MS Cognitive Services and Google Vision use AI to convert images into meaning.
- Analytics like Face Book Analytics and Azure App Insight forward bot behaviour to the dashboard to manage key performance indicators.

Core features

- Easy to use and developers can write, modify and build chatbots with a rich user experience
- Open source and a fully secure platform to design secure bots
- Seamless delivery of chatbots on varied messenger and voice assisted channels

Latest version: 0.0.3

Rasa Stack

Rasa is an open source chatbot development framework. It has two major components — Rasa NLU and Rasa Core, both of which allow for more human-like dialogue, and can be trained using interactive and supervised machine learning.

Rasa Core is a framework for building a conversational chatbot. It picks up patterns from real conversations; it also uses history and takes the external context of conversations into account.

Rasa NLU is an open source tool for intent classification and entity extraction, and offers NLU for bots and assistants. It turns natural language into structured data. It is modelled as a set of high-level APIs for building one's own language parser using existing NLP and ML libraries.

The major advantage of using Rasa Stack is that it can be deployed on your own server and hence enable you to keep all the components inhouse. It is possible to use Rasa Core or Rasa NLU separately. Rasa is production-ready and used in large companies everywhere.

Rasa Core supports Facebook Messenger, Rocket Chat, Slack,

Telegram and Twilio.

Rasa is available under two licences. Rasa NLU and Rasa Core are open source and written using the Python language.

Core features

- Rasa's framework context and dialogue management learns real conversations and improves performance without any code modifications
- Trains custom language models for high performance
- Saves time by reducing the need for training because of the use of built-in and pre-trained entities
- Machine learning models are fine tuned by its own custom model and domain for peak performance
- Open source, on-premise and highly extensible framework compared to commercial chatbot frameworks

Latest version: 0.11.12

Microsoft Bot Framework

This is an open source bot builder SDK that enables developers to build simple to high-end intelligent dialogues. Microsoft offers the Azure Bot Service which provides a scalable, integrated, connectivity and development service environment to create intelligent chatbots that can engage users across multiple platforms. It allows developers to speed up the development process. The Azure Bot Service has two components:

- Microsoft Bot Framework connectors
- BotBuilder SDK

Microsoft Bot Framework is a platform for building, connecting, testing and deploying powerful and intelligent bots on websites, apps, Skype, Slack, Facebook and many more platforms.

The BotBuilder SDK supports C#, JavaScript, Python and Java. The conversation can use simple text or more complex rich cards that contain text, images, and action buttons. The SDK also includes an emulator for debugging your bots, as well as a large set of sample bots that you can use as building blocks.

Microsoft Bot Framework connectors and BotBuilder SDK are the ideal solutions to consider when you are developing an omni-channel chatbot. It's very easy for the developers to connect the BotBuilder SDK with any natural language understanding (NLU) service. The BotBuilder SDK GitHub account has many code samples and templates which help developers to get started quickly.

Core features

- Conversational intelligence with language understanding services
- Converts speech to text and back to speech to understand user intent
- Uses the Bing Web Search API to search from billions of Web documents
- Easily evaluates sentiment using the Text Analytics API
- Powerful cognitive service

Latest version: SDK4
