

identity/authorisation source (e.g., *mod_auth_mellon* or LDAP).

These are not environment variables of the corresponding shell (e.g., BASH) in which Apache Service is running, but are Web environment variables. If we want to add more environment variables as per our requirements, then we can do the following:

- Temporarily add into the Perl script; in our case the *printenv \$ENV{MYMAG}="OPENSOURCEFORU"*;
- Through the *Apache Config* file permanently add

any variable and value to it, before restarting the Apache service:

- *SetEnv MYLANG PERL* (this is facilitated by the *mod_env* module)
- *PerlSetEnv MYLANG PERL* (this is applicable only for *mod_perl* and only visible in *cgi-perl/printenv*)

In the list we see the following two environment variables that stand out for *mod_perl*:

- *MOD_PERL=mod_perl/2.0.10*
- *MOD_PERL_API_VERSION=2*

These are specifically created by *mod_perl*, apart from the

Table 1: *printenv* output
