

can perform rolling upgrades including parallelisation and support for host reboot, allowing the moving of workloads off the node by using live migration.

SUSE's Academic Program expands to include over 400 institutions

SUSE, a pioneer in open source software, has expanded its open source software education to hundreds of educational institutions worldwide. The company is extending its support for its SUSE Academic Program for the next generation of open source software developers across the world. The aim of the programme is to enable developers in all industries to address the changing demands of the digital

economy by offering open source knowledge, material for training and an affordable education-buying programme for academia.

Founded in May 2017, the SUSE Academic Program now includes over 400 universities, libraries, schools and other institutions. In addition, support

resources of the programmes have increased in North America. The aim of the programme is to double the number of participants in the next six months.

Sander Huyts, VP and Academic Program lead, SUSE, said, "SUSE has long been a champion of open source education, and our existing links to academia have allowed us to work with a high number of schools in a short period of time."

"We are committed to growing open source skills and education at the academic level, because we view them as critical to the long-term health of our industry and as fundamental building blocks of modern technology. We will continue to ramp resources and support to ensure open source continues to thrive," Huyts said.

The SUSE Academic Program is positively impacting the lives of students and educators across the world. The educational institutions using the program include Oxford University, Cambridge University, San Diego State University, Czech Technical University, University of British Columbia and New York City College of Technology.

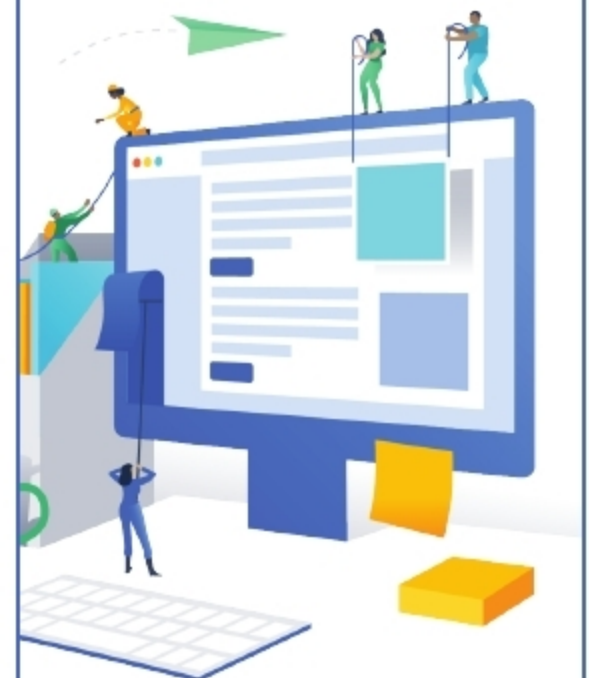

Commenting on the use of the SUSE Academic Program, Werner Degenhardt, academic director and CIO at the Faculty of Psychology and Educational Sciences, Ludwig Maximilian University of Munich, said, "Our university has been using this program for a number of students as part of the curriculum for the systems specialist program—for internal teaching and learning purposes. We love the program, find it very easy to use and have seen it produce excellent results."

Phillip Chee, computer science technologist and professor at Fleming College in Peterborough, Ontario, said, "The materials provided in the SUSE Academic Program are very impressive. I am using the program to develop a lab for the students to install a small cloud, and incorporating SUSE OpenStack Cloud into our operating system theory class."

The SUSE Academic Program offers a wide range of solutions to help meet the demand for advanced open source knowledge and talent. The solutions include training for certified Linux and other courses, free SUSE products for educational or lab use, student curriculum materials for faculty and staff, development tools, a special SUSE buying programme for educational institutions; and access to forums, the knowledge base and technical support.
