

DVD OF THE MONTH

This collection of open source software will help to boost the security of your organisation's software systems.

BackBox Linux 5.2 (64-bit)

This is a Linux distribution based on Ubuntu, which has been developed to perform penetration tests and security assessments. It has been designed to be fast, easy to use and provide a minimal yet complete desktop environment. BackBox comes with its own software repositories, which are always up-to-date with the latest stable versions of the most used and best known ethical hacking tools. You can find out how to install and use this Linux distro at <https://wiki.backbox.org>. You can use the bundled DVD in the live bootable mode. The ISO image for the 64-bit live edition can be found on the DVD under the *other_isos* folder.

Q4OS 2.7

This is a fast and powerful operating system based on the latest technologies, offering a highly productive desktop environment. The focus is on security, reliability, long-term stability and the integration of verified new features. The system is designed to work with very low hardware requirements. It is great for brand new machines as well as legacy computers. The ISO image for the 64-bit live edition can be found on the DVD under the *other_isos* folder.

Firewalls

To boost the security of your network and working environment, a few community editions of popular open source firewalls have been included in the DVD. To try them out you can find the installable image of the pfsense, VyOS, IPFire and Endian firewalls in the bundled DVD under the *firewalls* folder.

What is a live DVD?

A live CD/DVD or live disk contains a bootable operating system, the core program of any computer, which is designed to run your programs and manage all your hardware and software.

Live CDs/DVDs have the ability to run a complete, modern OS on a computer even without secondary storage, such as a hard disk drive. The CD/DVD directly runs the OS and other applications from the DVD drive itself. Thus, a live disk allows you to try the OS before you install it, without erasing or installing anything on your current system. Such disks are used to demonstrate features or try out a release. They are also used for testing hardware functionality, before actual installation.

To run a live DVD, you need to boot your computer using the disk in the ROM drive. To know how to set a boot device in BIOS, please refer to the hardware documentation for your computer/laptop.
