

Comcast is also instrumental in setting up an independent consortium named the RDK Management Project, which is focused on creating software to support advanced video and broadband experiences. The RDK software uses the Yocto build system to create a consistent layer such that everyone (from the semiconductor vendors to OEMs and ISVs) can use a consistent system and structure to build the content for set-top boxes and similar devices.

Comcast open sourced Trickster, a new tool, we developed to make Prometheus dashboards run smoother and faster. Trickster was developed internally and recently made available in open source. Written in Go, Trickster is a reverse proxy cache for the Prometheus HTTP APIv1 that considerably accelerates dashboard rendering times for any series queried from Prometheus.

Q Please tell us about Comcast's collaboration with external organisations?

Comcast is a member of a number of foundations, as I mentioned earlier, including the Yocto Project, Linaro, the

Linux Networking Fund, Cloud Native Compute Foundation and ToDo Group.

Through contributions to these organisations, Comcast has benefited from the goodwill that comes from participating in open source communities. Comcast's contributions have also helped the company recruit new developers, who today want to work for companies that are good open source citizens. Comcast's contributions in a variety of communities demonstrate that it is serious about its commitment to open source.

Q How do you make sure that your open source strategies are aligned with your business goals?

It is important to make sure that your company's open source strategies are closely aligned with its business strategy. The open source office should really understand the goals of the company and enable them in its open source strategy. At Comcast, this strategic alignment allows the open source practice to remain aligned with the broader company goals, encouraging long-term success for the practice and the company as a whole. **END** 🐧
