

on November 9, 2015. Its flexible architecture allows easy deployment of computations across a variety of platforms (CPUs, GPUs and TPUs), and from desktops and clusters of servers to mobiles and edge devices.

TensorFlow is currently the top trending machine learning framework; it also supports APIs for beginners and experts to develop desktop, mobile, Web and cloud based applications.

3) Ansible

Ansible is an open source IT automation tool. It provides configuration management, infrastructure orchestration, task automation and more advanced IT tasks such as continuous deployments or zero downtime rolling updates. Ansible's main feature is that it is agent-less, i.e., no software or agent is installed on the client that communicates back to the server. It is written in Python and uses YAML for its playbook language, both of which are considered relatively easy to learn.

4) Vue.js

Vue.js (Vue) is an open source JavaScript framework for building user interfaces. First released in February 2014, it is one of the most popular JavaScript frameworks in the market. Its GitHub page has 123,936 stars. Vue.js features an incrementally adoptable architecture that focuses on the view layer only, and is easy to integrate with other libraries or existing projects. It also offers officially maintained libraries and packages for complex applications such as routing (vue-router), state management (vuex) and building tools.

5) React Native

React Native is a JavaScript framework for building native mobile apps using JavaScript and React. It's an open source project which comes under the MIT License. React Native is built on top of ReactJS. It is a great choice for developers with expertise in JavaScript as there is no need to learn Android-specific Java or iOS's Swift.

As per the GitHub blog, 2018 witnessed the biggest increase in the number of open source projects related to non-language topics compared to 2017. The JavaScript framework was the most popular language for new open source projects in 2018, while React Native was the runner up in the top 10 open source projects based on contributors.

6) Angular CLI

Angular CLI is an open source command-line interface tool that can be used to initialise, develop, scaffold and maintain Angular applications. You can use Angular CLI directly in a command shell, or indirectly through an interactive UI such as Angular Console. Angular CLI creates, manages, builds and tests Angular projects. It is one of the top trending open source projects based on GitHub activity.

7) Vault

Vault is an open source tool for secrets management, 'encryption as a service' and privileged access management. Modern systems require secrets in multiple areas like database credentials, API keys for external services, credentials for service-oriented architecture communication, etc. Vault provides a unified interface for any secret, while providing tight access control and recording a detailed audit log.

8) Keras

Keras is an open source neural network library written in Python that is capable of running on top of TensorFlow, Microsoft Cognitive Toolkit, or Theano. Keras was the tenth most popular tool in the KD Nuggets 2018 software poll, with 22 per cent of respondents using it.

9) Kubernetes

Kubernetes is an open source container-orchestration system designed for the automation of deployment and scaling, and for the management of containerised applications. It was originally designed by Google and is now maintained by the Cloud Native Computing Foundation. Kubernetes ranked eighth on the list of top open source projects at GitHub, based on the contributor count.

10) Bitcoin

The blockchain is one of the top tech trends of the past year and has seen a lot of interest. The most popular open source blockchain project is Bitcoin, which is an experimental digital currency that enables instant payments to anyone, anywhere in the world. Bitcoin uses peer-to-peer technology to function without a central authority — the network collectively manages transactions and issues money. Bitcoin was released as open source software in 2009.

I have listed ten trending open source projects of 2018. However, there are many other projects that are also growing rapidly, like Flutter, Deno (a secure TypeScript runtime on V8), ValveSoftware/Proton for porting games to Linux, and Detectron (from Facebook AI Research) to support research in image recognition algorithms. **END** 🐧
