

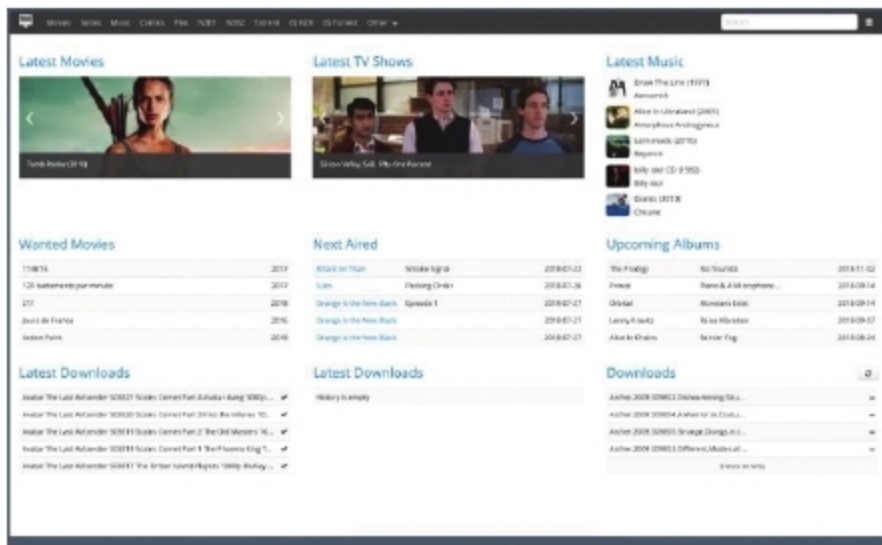

Figure 6: OpenFLIXR GUI

OpenFLIXR focuses on automation, and its objective is to provide an all-in-one solution. Its software automatically downloads, installs and updates select programs.

This home media server is a combination of all well-known open source projects out there, including Plex Media server (that organises movies, series, music and pictures, and streams them), Ubooquity (that serves comics and ebooks), and a Web based reader. It also supports other tools for additional services — CouchPotato, SickRage, Headphones and SABnzbd — to enhance the user experience.

All programs are optimised to work together so it takes very little time to set it up. Being a virtual appliance, OpenFLIXR allows you to run it on any platform. The only thing you need is a hypervisor like VirtualBox (open source), VMware Fusion/Workstation/Player/ESXi, Parallels Desktop, KVM/unRAID or Microsoft Hyper-V.

Technical features

- Completely automated media server with a simple interface and easy installation.
- Complete all-in-one virtual appliance.
- Simple Web interface including monitoring and management tools.

Latest version: 2.5

7. OSMC or Open Source Media Center

OSMC is a simple, full-featured, easy to use, open source and highly intuitive media server-cum-media streamer software based on Kodi and Debian. It is licensed under version 2 of the GPL, which gives anyone power to use it freely and to make any changes to the code. OSMC can play all major media formats and supports a variety of sharing protocols to be able to stream from other devices. It can stream media and serve files to other devices as well.

It also offers paid hardware kits and other accessories to enhance the OSMC user experience such as the Vero 4K, which supports 4K, HEVC, 10-bit content and HD audio.

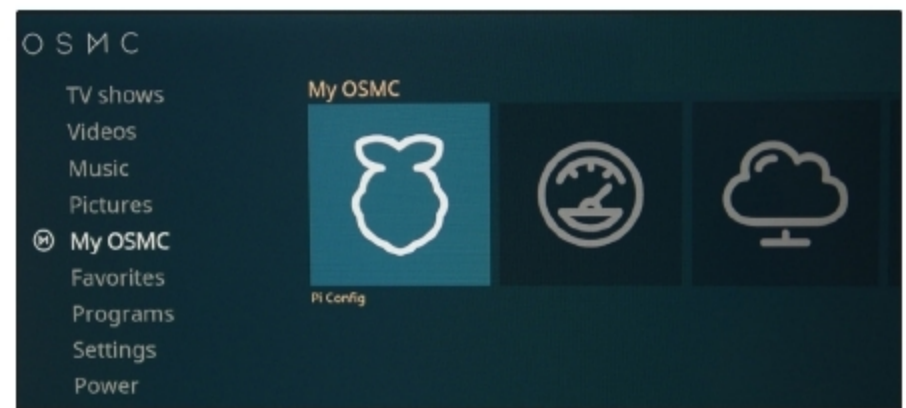

Figure 7: OSMC GUI

Technical features

- OSMC is a simple, easy-to-use OS that has over 30,000 packages available in its repositories, which makes it a very comprehensive media server player.
- Its app store adds new features to enhance a user's HTPC experience, with everything from YouTube to ESPN 3, and even Netflix. It supports watching live TV via the HDHomeRun app.
- OSMC lets you play back media from your local network, attached storage and the Internet.
- It is self-updating, which means it keeps getting better each month.

Latest version: 2018-10-1

8. Gerbera

Gerbera is a powerful, lightweight, feature-rich and open source UPnP media server software built on MediaTomb. It allows users to stream digital media (videos, images, audio, etc) through a home network and consume it on different types of UPnP compatible devices, ranging from mobile phones to tablets and more.

Gerbera automatically extracts metadata from a user's music files. When combined with the power of JavaScript, the layout of the collection as per user requirements can be created on all devices.

Technical features

- Metadata extraction from Mp3, Ogg, Flac and Jpeg files; Exif thumbnail support.
- Support for ContentDirectoryService container updates.
