

The scope of Kubernetes Storage SIG includes the following volume operations:

- Creation of persistent volume claims and persistent volumes
- Storage classes and dynamic provisioning
- Managing Kubernetes volume plugins
- Adhering to Container Storage Interface (CSI)
- Management of secret volumes, ConfigMap volumes, DownwardAPI volumes and EmptyDir volumes in association with Node SIG

SIG Storage is not responsible for managing the following:

- The data path of remote storage (GCE PD, AWS EBS, NFS, etc)
 - How bits are transferred
 - Where bits are stored
- The container writable layer
 - Vendor-specific storage plugins/drivers

The recently released Kubernetes 1.13 has added options for topology-aware volume provisioning. Prior to this feature, dynamic provisioning was handled independently from pod scheduling, resulting in a PersistentVolumeClaim (PVC) getting created in an entirely different zone and/or in pods that could not be completely scheduled for various reasons. The new feature improves the multi-zone cluster experience with persistent volumes. It allows Kubernetes to make intelligent decisions when dynamically provisioning volumes by getting scheduler input on the best place to provision a volume for a pod.

Contributing to Storage SIG

Here is some basic information that will help anyone interested in contributing to Storage SIG:

- There are SIG public meetings every two weeks, on Thursdays, at 10.30 p.m. IST (9 a.m. PT).
- If readers are interested in contributing to the storage features in Kubernetes, they should read the storage SIG guide for new contributors at <https://github.com/kubernetes/community/blob/master/sig-storage/contributing.md>.
- They can join the discussion on Kubernetes Slack at the sig-storage channel.
- Documentation for currently supported volume plugins is available at <https://kubernetes.io/docs/concepts/storage/volumes/>. **END** 🐧
