

A handful of prominent publishers in the West have a monopoly over academic journals published worldwide. An academic or scholarly journal is a periodical publication in which a scholarship relating to a particular academic discipline is generated, says Wikipedia. It is a very important route for creating and sharing high-quality scholarly knowledge in any field. OJS allows you to start an academic journal, have it peer-reviewed, present the articles once produced, and also manage the entire editorial workflow (including article submission).

Among the other top tools for libraries, **SubjectPlus** is an open source subject guide tool. **LibKi** is a public kiosk management system for libraries; it helps to manage your public computers. **BibApp** is a research social network. **Guide on the Slide** walks those visiting the library on how to use the system. **OpenRoom** manages reservations for a library's public spaces. Also from the world of FOSS, **Omeka** is a collections-based Web publishing platform that is meant "for cultural heritage institutions, researchers, scholars and students." Links to all these tools are given in the box on this page.

There is even a FOSS site especially for sharing information among libraries on how they can get access to the best free and open source software. See <https://foss4lib.org> (together with its accompanying Twitter page at <https://twitter.com/FOSS4Lib>).

The top ten FOSS tools for libraries

- Koha: <https://koha-community.org/>
- Evergreen: <http://evergreen-ils.org/>
- SubjectPlus: <http://www.subjectsplus.com/>
- Libki: <http://libki.org/>
- Bibapp: <http://bibapp.org/>
- Guide on the Slide: <http://code.libraryarizona.edu/gots/>
- OpenRoom: <http://www.bsu.edu/libraries/getopenroom/>
- Omeka: <http://omeka.org/>
- Open Journal System: <https://pkp.sfu.ca/ojs/>
- FOSS4Lib: <https://foss4lib.org>

FOSS can also be used in other book-related applications. Take a look at this freely-shareable ebook, which talks about its use in libraries: <https://opensource.com/resources/ebook/open-source-library-guide>. **END** 

By Frederick Noronha

The author runs a free and open library in his village in Goa, and also founded the Goa Libraries Network on WhatsApp. He loves books, libraries and FOSS. You can reach him at fredericknoronha2@gmail.com.

Continued From Page....52

The next entry in the list is Kotlin, a statically typed programming language which was first released in 2011. Kotlin runs over the Java virtual machine and is widely used for Android app development. Kotlin has been released under the Apache licence.

The next entry in the list of promising programming languages is Julia. Even though Julia is a general-purpose programming language, it is used a lot for numerical and computational analysis, making it mainly a scientific programming language. Julia is released under the MIT licence and GNU General Public License Version 2.

The next entry in the list is TypeScript, which is developed by Microsoft and was first released in 2012. But, to our surprise, it is also an open source programming language released under Apache License 2.0. A big advantage of TypeScript is that it is a superset of JavaScript; so existing JavaScript programs are valid as TypeScript programs also.

The final entry in the list of promising programming languages is Dart, a general-purpose programming language first released in 2011. It is yet another language that's developed by Google. Dart has been released under the BSD licence. The syntax of Dart is similar to the C programming language.

So, the final list of seven promising programming languages features Swift, Go, Rust, Kotlin, Julia, TypeScript, and Dart. There is a high probability that at least a few of these will be permanent fixtures in the top ten

lists in the near future itself. So, it would be a good idea to start learning some of them, if you are a serious developer.

Do remember that I haven't created these lists based on my personal preferences. So, if your favourite programming language is absent from a particular list, rather than blame me, remember that I was merely an aggregator of facts found in the four ranking schemes with specific biases. It will be highly beneficial if the readers go through the four ranking schemes (mentioned at the beginning of the article) further to elicit more information regarding the popularity of these programming languages. In addition to these four ranking schemes, I urge the readers to go through the Stack Overflow Developer Survey also. This survey began in December 2010 and has been conducted annually ever since. The results of the latest survey conducted in December 2018 are available at <https://insights.stackoverflow.com/survey/2018/>. This survey not only analyses the popularity of programming languages but also examines the social, economical and psychological aspects of programmers and their lives. **END**
