

The easiest solution is to create a bridge network. The option to configure one is included in the Fedora workstation. We need to make sure that:

- The mobile hotspot uses the same address range as the Ethernet interface.
- The mobile hotspot does not act as a DHCP server.

In the following, it is assumed that the IP address of the mobile hotspot is 192.168.1.1.

We can create a new network connection as follows:

- Select the type of bridge (under virtual devices), e.g., *bridge0*
- Allocate a fixed IP, e.g., 192.168.1.10
- Add the first bridged connection as the Ethernet interface, e.g., *enp4s0*
- Add the second bridged connection as the USB Ethernet connection of the hotspot, e.g., *enp0s16f0u1*

Delete any other network connections which use either of the two ports used in the *bridge0* connection.

In the *dnsmasq.conf* file, modify the interface to use the bridge interface:

```
# interface=enp4s0
interface=bridge0
```

When the network is restarted, *netstat -r* should show the *bridge0* interface.

The firewall should open the same ports as mentioned for the Ethernet interface for the hotspot interface, *enp0s16f0u1*, as well. Any device connected to the hotspot should be able to access the personal cloud storage.

Seagate Media – the phone app

Seagate provides an app Seagate Media, which allows easy usage of the local storage device. You can access the files, see the images and play the videos, including the option to Chromecast them. If all is well, the Seagate Media app will find the Seagate Central device with the name given, e.g., MyCloud.

The app includes a setting for auto backup of files to the storage device.

Caution

The Seagate Central expects to be on all the time. Powering off can be done through the Web interface. This does raise the possibility of problems in our environment. An inexpensive UPS may not provide the perfect protection against power fluctuations or outages.

So, if you wish to avoid cloud storage completely, make sure that the personal cloud is also backed up!

In principle, you should be able to use storage on your workstation. However, the mobile apps are usually provided by the vendor of the personal cloud—a separate app for each vendor with the same functionality but incompatible with each other. (No wonder, there are millions of apps.) We need to explore open source apps for Android which integrate well with Linux. But let's leave that for another day. **END** 🐧

OSFY Magazine Attractions During 2018-19

MONTH	THEME
March 2018	Databases management and Optimisation
April 2018	Docker and containers
May 2018	Open Source Programming (Languages and tools)
June 2018	Open Source Firewall and Network security and Monitoring
July 2018	Mobile App Development and Optimisation
August 2018	AI, Deep learning and Machine Learning
September 2018	Open Source and IoT
October 2018	BigData, Hadoop, PaaS, SaaS, IaaS and Cloud
November 2018	Open Source on Windows
December 2018	Web Development
January 2019	Data Security, Storage and Backup
February 2019	Best in the world of Open Source (Tools and Services)
