

Managing Enterprise Content and Documents Using Open Source Tools

Enterprise content management (ECM) is the technology used to capture, manage, store, preserve, and deliver content and documents related to organisational processes. ECM plays a big role in the safety and security of enterprise documentation, and can be very well managed using open source tools.

The backup and recovery of files includes repository management with secured tools and libraries so that the organisation's confidential documents can be preserved, used and transmitted securely. Enterprises must have secured and effective software with the right tools and technologies, so that their files and documents can be stored in a privacy-aware environment. The proprietary as well as open source software distributions used by the corporate and academic organisations include storage wallets with communication options. By using communication tools in these software products, users can send and receive files and documents for specific purposes. These software products act as an enterprise based private cloud that has all the data, files and documents relating to the organisation.

Often, these software tools can be used as enterprise resource management (ERM) tools, which include enterprise content management (ECM) and enterprise document management systems (EDMS). Such tools and software suites are used to share, distribute and preserve documents within the organisation. By using organisation-level documents repository management, the integrity and security of the digital assets of the firm or institution can be maintained.

For example, if an employee is willing to send a confidential document to a higher authority or boss, the former can directly share that file using these software tools rather than send that file via email. In this way, the overall communication is logged and recorded with the timestamp and the entire history and details of the communication, for long term reference and use.

Digital assets management (along with knowledge management) is one of the key goals that is achieved using these software products. Such tools and products are also used for knowledge transfer within an organisation so that the induction and training of new employees can be done with minimum time loss, and with explanations of the organisation's structure, processes and workflow. Without such tools, the induction of new employees becomes difficult because of the huge documentation process. Tools with EDMS and ECM ensure proper documentation and deliver the overall processes to employees in particular units or departments.

With the adoption of such EDMS and ECM based tools, various technologies and solutions are used to integrate the following activities.
