Alfresco: This provides multi-layered security for documents management with the integration of access permissions on different types of files and documents. It has the full roll-back features so that any accidental removal of data can be recovered by the administrators. In addition, Alfresco provides simple but highly effective records management so that multiple departments and sections of the organisation can communicate in a secure manner.

Alfresco is more focused towards data management for large enterprises with multiple options for multimedia files management, content repository, document management, Web content management, etc. It is a cross-platform software application that can be executed on assorted operating systems. There are numerous add-on plugins and modules for multiple applications that can be attached with an Alfresco installation.

The community edition of Alfresco can be downloaded from <https://www.alfresco.com/products/community/download>. The software provides the options to create users with different rights on the documents. In addition, files and documents of different formats can be processed in the software.

OpenDocMan: OpenDocMan is free and multi-functional document management software. It is written in PHP and can be customised for the modules as per the requirements of the organisation. OpenDocMan can be installed and deployed on any traditional Web server with PHP for scripting and customisation. Using this DMS, the files can be directly uploaded without the need of FTP. In addition, there is an in-built installer for different plugins and additional modules.

Support for multiple international and regional languages is available so that the content can be directly translated from one language to another without any complexities. OpenDocMan provides a full-fledged Web based interface so that it can be deployed on the cloud for remote access and on multiple devices.
