

Any type of document can be uploaded and indexed in OpenDocMan with the allocation of permissions, for the security and authentication of confidential documents.

The admin panel of OpenDocMan includes options to manage multiple branches in the organisation including users, departments, categories, files, roles, etc. The individual files and documents can be associated with the specific roles and rights of users for secured access.

SeedDMS: This is another powerful EDMS. SeedDMS provides a Web based interface for cloud integration and 'anywhere' access on multiple devices and Web clients. It has a base of PHP, SQLITE and MySQL, and can be installed on any type of platform like Windows, Mac or Linux. SeedDMS is entirely compatible with LetoDMS, its predecessor.

SeedDMS provides assorted functions and features for the storage and retrieval of documents. These include meta-data management, advanced search, workflow management, files conversion, full text search and many others.

Kimios: Kimios DMS is a lightweight but fast document management system that offers secured and dynamic storage for an organisation's documents, with deep search based indexing and bookmarking for advanced search and export to different formats. Using Kimios, the complete life cycle of the documents can be managed with versioning control.

Kimios delivers a customised but highly effective search engine for the identification of files and documents from different locations. In addition, the management of user rights and privileges is very effective, with the secured delivery of documents to other users. Kimios provides desktop integration with installation capabilities on multiple platforms. The capability to drag-and-drop files to the working panel adds to the user friendly nature of the software.

Scope for adoption

The adoption of specific document and content management systems entirely depends on the type and size of the organisation. For large enterprises, Alfresco or OpenKM are popular as these can handle Big Data files. For small and medium sized organisations, OpenDocMan, Kimios, SeedDMS or

similar software applications can be used. These are fully customisable software tools that can be enhanced as per the requirements of various departments in the organisation. Universities and academic institutes can also install and work with such software tools to keep documents secure and to be able to transmit them via private ERP.
