

open source virtualisation management platform Proxmox VE 5.2 is based on Debian 9.4, and uses an updated and modified Linux kernel 4.15. Proxmox VE 5.2 also delivers other features for improved usability, scalability and security. These include:

- Creating clusters via the graphical user interface
- Creating templates or moving disks from one storage to another storage which works not only for VM but now also works for Linux Container (LXC)
- Administrators can now easily create and edit new roles via the GUI
- Setting I/O limits for restore operations is possible, to avoid I/O load getting too high while restoring a backup
- Configuration of *ebtables* in the Proxmox VE firewall

Proxmox has been around for more than 13 years. Started as a self-funded open source project, it's now a global tech business. According to its official

site, Proxmox VE has 200,000 host installations in 142 countries, which include 11,000 customers comprising businesses of varying sizes as well as universities, governments, research organisations, NGOs and corporates.

For deployment and support on Proxmox, you can reach out to its partners who provide a wide variety of software, hardware and services. TechnoInfotech is the first official reseller partner of Proxmox in India. It provides advanced support for planning, deployment and implementation to customers on top of the support subscriptions—be it local or remote.

TechnoInfotech believes Proxmox VE is a great technology investment, which offers peace of mind for the IT team and the management, with very competitive pricing.

In upcoming articles we will explore the features of Proxmox VE in detail—from the deployment point of view, for real use cases. These will cover how to get various Windows and Linux VMs up, and how to create backup, restore, snapshots, replication, HA works, etc. For SMEs, we will cover how to plan for the hyper converged infrastructure with minimum requirements. **END**

The author has enjoyed working on Linux and other open source projects for the last 16+ years. You can reach him at deepen@technoinfotech.com or connect with him at <https://linkedin.com/in/deependhulla>.

Continued from page no 67...

6. Supports automatic removal of old records, hence simplifying the database administration.
7. Any of the SQL database engines can be used by Bacula, making it quite flexible.
8. Provides a built-in job scheduler.
9. Supports a rescue CD for Linux systems.

BAREOS

Also referred to as Backup Archiving Recovery Open Sourced, this is actually a network based open source backup solution. It can do backups to tape and disk drives including tape libraries. Apart from common backup strategies like incremental, full and differential, BAREOS also offers copies, migrations, virtual full backups and de-duplication with the help of base jobs. By using migrations, a backup into the cloud is also possible.

Features:

1. Supports almost all of the well-established OSs like UNIX, Linux, Windows and MacOS X.
2. It supports encryption and compression, both hardware and software based.
3. The latest release of BAREOS also offers native integration for different cloud storage technologies

like GlusterFS (Red Hat Storage), Ceph, etc. It allows backups to be directly written into the cloud backend. It is comparatively secure because of the available data encryption and transport.

4. With the help of the self-backup feature, it gets back into operation rapidly in case of disasters.
5. The software is available as open source, and offers completely open interfaces so that it can easily integrate with existing IT environments.
6. It supports IPv6 and the passive client feature, with which it can be easily integrated with complex networks while complying with the security guidelines.
7. It provides efficient bandwidth utilisation and practical console commands. **END**
