

- **Monitoring options:** It supports historic statistics server (graphical statistics), real-time network and CPU statistics, S.M.A.R.T, email alerts, SNMP, syslog, etc.
- **Virtualisation host:** XigmaNAS includes an integrated Web based virtualbox host that can run virtual machines managed by noVNC and phpvirtualbox.

Latest version: 11.2.0.4.6195

Openmediavault

Openmediavault is an advanced, next-generation, open source NAS solution based on Debian Linux. It was designed by Volker Theile mainly for home and small offices, and provides an easy to use GUI solution for managing NAS storage hardware. It contains tons of services like SSH, FTP, SMB/CIFS, DAAP media server, RSync, BitTorrent etc. The software has a completely modular design and can be made more advanced with tons of features using plugins integrated into the base system, and even with third party plugins using the OMV-Extras repository.

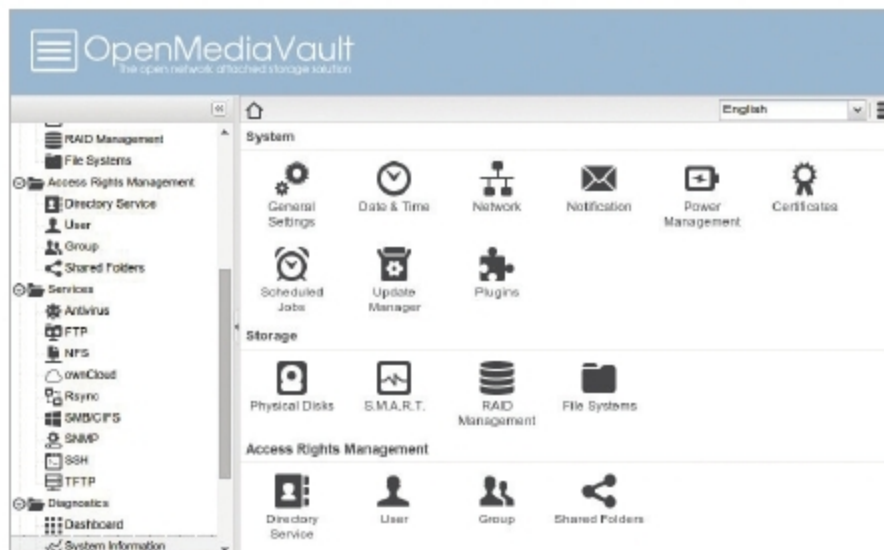

Figure 5: Openmediavault

Features

- **Web interface and notifications:** It has an easy and advanced Web UI supported via SSL with an advanced notification system to provide alerts regarding scheduled tasks like monitoring, S.M.A.R.T and cron-apt.
- **Storage management:** It displays advanced information with regard to S.M.A.R.T, supports RAID 0, 1, 5, 6 and 10, and even supports the LVM2 plugin.
- **Services:** Openmediavault supports almost all the different types of services like SMB/CIFS, FTP, RSync, NFS, SSH, TFTP, etc.
- **Miscellaneous features:** These include IPv6 support, Wake on LAN (WoL) and extendible via plugins.

Latest version: 4.1.12

Openfiler

Openfiler is a Linux based open source operating system that provides file-based network attached storage (NAS) and block-based storage area network (SAN). It enables systems

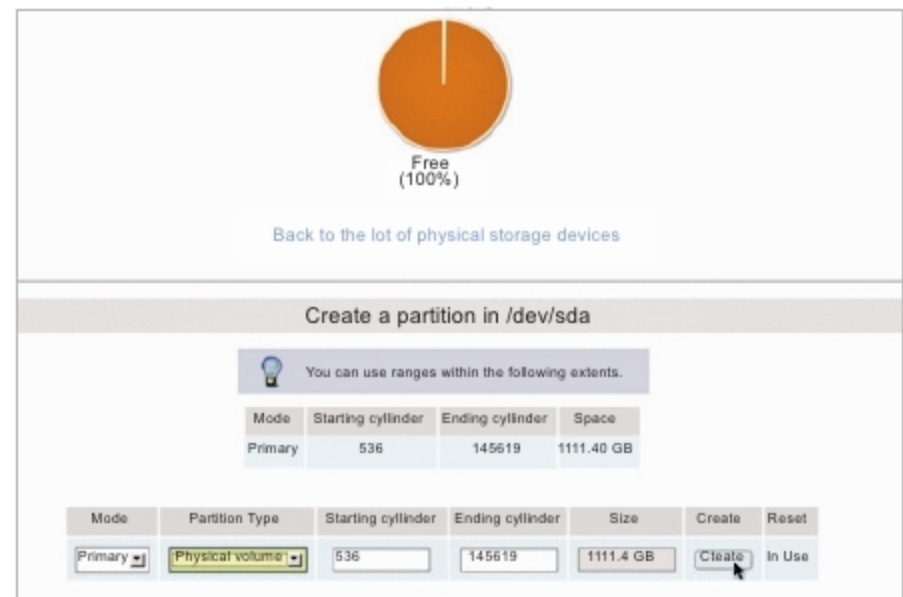

Figure 6: Openfiler

administrators to create reliable, efficient and highly powerful NAS solutions managed via an easy to use browser user interface. OpenFiler supports file-based storage networking protocols like NFS and CIFS, which ensures cross-platform compatibility with Windows, Linux and even UNIX. It also helps iSCSI and fibre channel to be easily implemented in virtualised environments like VMware and XenServer.

With Openfiler's Web based management system, systems administrators can easily create and manage storage systems using protocols such as NFS 3, SMB/CIFS, WebDAV (Web based distributed authoring and versioning), HTTP/1.1, FTP (file transfer protocol) and iSCSI. You can also configure storage using RAID levels such as 0, 1, 5, 6 and 10. Openfiler can even be integrated with authentication mechanisms such as LDAP, active directory, Network Information Service (NIS) and Hesiod for secure storage access.

Features

- It supports authentication using pluggable authentication modules, configured from the Web interface.
- Openfiler supports both software and hardware RAID with monitoring and alert facilities, volume snapshot and recovery.
- It supports active/passive high availability clustering, multipath I/O (MPIO) and block level replication.
- It supports NIS, LDAP and Windows NT/active directory authentication, flexible quota management and easy-to-use Web based admin GUI.
- It provides file system scalability up to 60TB+, an online file system and volume growth support.

Latest version: 2.99
