

FoundationDB Document Layer now available on GitHub

FoundationDB is open sourcing the FoundationDB Document Layer, a document-oriented database. This will extend the core functionality of the FoundationDB key-value store.

FoundationDB is a distributed database designed to handle large volumes of structured data across clusters of commodity servers. It organises the data in ordered key-value store format and employs ACID transactions for all operations.

The FoundationDB Document Layer is a stateless micro-server, which is backed by the scalable and transactional features of FoundationDB. Released under an Apache v2 licence, it provides the ease-of-use of a document database in the form of the familiar MongoDB API. The Document Layer extends FoundationDB to add a number of features such as indexes, data typing and query engine.

“The FoundationDB key-value store is powerful, but its features remain narrowly scoped to distributed transactions and stateful storage. The Document Layer takes the key-value store’s focused API and uses it to model a much more complex style of data storage,” said the team at FoundationDB in a blog. “Because the Document Layer exposes a new, general-purpose API, we think of this as an extension to FoundationDB,” the team blog post added.

Twistlock open sources its new Cloud Discovery tool

Twistlock has released a new open source tool called Cloud Discovery. The first release supports Amazon Web Services (AWS), Microsoft Azure and Google Cloud Platform (GCP).

Cloud Discovery gives enterprise infrastructure, operations, and security teams the ability to easily understand and quantify the computing resources available to them. This powerful tool is used by audit and security practitioners who want a simple way to discover all the ‘unknown unknowns’ across environments without having to manually log in to multiple provider consoles, click through many pages, and physically export the data.

Cloud Discovery connects to cloud providers’ native platform APIs to discover services and their meta data, and requires only read permissions. It also has a network discovery option that uses port scanning to sweep IP ranges and discover cloud native infrastructure and apps (such as Docker Registries and Kubernetes API servers) with weak settings or authentication.

Key features include:

- Scans networks to discover cloud native infrastructure and applications, such as Docker registries and Kubernetes API servers
- Instantly identifies weak settings and authentication
- Easily integrates into DevSecOps processes
- Is provided as a simple Docker container image that can be run anywhere and requires only read permissions to cloud accounts
- Works well for both interactive use and automation
- Outputs data into standard JSON for easy integration with other tools
- Written in Go

“Since our founding, we’ve been committed to enhancing security efforts for the cloud native community through upstream contributions to open source projects,” said Ben Bernstein, chief executive officer, Twistlock. “From creating the authorisation framework within Docker and Openshift and secrets management for Docker Swarm, to the release of Cloud Discovery — open source is in our DNA. We hope Cloud Discovery helps the community and look forward to adding new features and components that benefit everyone,” Bernstein added.

Cloud interoperability and app mobility outrank cost and security as benefits of hybrid clouds

Enterprises are planning to increase hybrid cloud usage, claims a study published by Nutanix. The study adds that 91 per cent of the participants stated that the hybrid

cloud was the ideal IT model while only 18 per cent stated they have that model today. The findings also revealed application mobility across any cloud as a top priority for 97 per cent of respondents.

Interoperability between cloud types (23 per cent) and the ability to move applications back and forth between clouds (16 per cent) outranked cost (6 per cent) and security (5 per cent) as the primary benefits of using the hybrid cloud.

Ben Gibson, chief marketing officer for Nutanix, said, “As enterprises demand stronger application mobility and interoperability, they are increasingly choosing hybrid cloud infrastructure. While the advent of the public cloud has increased IT
