

efficiency in certain areas, hybrid cloud capabilities are the next step in providing the freedom to dynamically provision and manage applications based on business needs. However, the findings of this study reveal an important gap in the market—organisations need IT talent to manage their hybrid cloud models, especially in the next 12 to 24 months.”

The report highlighted that the hybrid cloud better addresses business needs compared to the single public cloud. Eighty-seven per cent of respondents said that hybrid cloud as an IT trend is having a positive impact on their businesses, and more hybrid cloud users reported all their needs were being met (49 per cent) compared to single public cloud users (37 per cent).

Further, organisations that use the public cloud spend 26 per cent of their annual IT budget on it. Perhaps most striking is the fact that only 6 per cent using the public cloud came in under budget, while nearly six times as many (35 per cent) overspent in their use of public cloud resources.

Seventy-one per cent of respondents surveyed for the report ranked data security and regulatory compliance as the top factor in determining where to provision their workloads. This was followed by performance at 62 per cent, ease of management at 53 per cent, and cost at 52 per cent.

According to the report, EMEA (Europe, Middle East and Africa) is expected to surpass the Americas in terms of hybrid cloud adoption.

The report said, “Regionally, the Americas reported greater use of hybrid clouds now (22 per cent) and within 12 months’ time (31 per cent). However, the two-year outlook has EMEA (43 per cent) surpassing the Americas’ hybrid plans (39 per cent) and APJ or Asia Pacific + Japan (39 per cent) catching up.”

The other key findings of the study mentioned ‘finding hybrid IT talent’ as difficult. Respondents who took part in the study pointed out the scarcity of hybrid cloud expertise as a challenge. Fifty-four per cent of participants claimed talent retention as a part of the problem.

With 2,300 respondents from multiple industries, business sizes and geographies, the survey questioned IT decision makers about where they are running their business applications today, where they plan to run them in the future, challenges in setting up their cloud environments and how their cloud initiatives stack up against other IT projects and priorities.

The study included businesses located in the Americas; Europe, the Middle East and Africa (EMEA); and Asia-Pacific and Japan (APJ) regions.

As per the study, the hybrid cloud meant the combined use of at least one private cloud and at least one public cloud service, with some degree of integration between the two cloud environments.

Microsoft to replace HockeyApp with Visual Studio App Center

Microsoft has announced plans to shut down HockeyApp and replace it with Visual Studio App Center. The service will officially shut down on November 16, 2019, the company said.

The company has already released its transition plan for migrating from HockeyApp to Visual Studio App Center. It has also put up a page with a feature roadmap to help the transition. “Starting November 16, 2019, all HockeyApp customers will use the next generation of distribution, crash reporting, and analytics services in App Center. HockeyApp will no longer be accessible,” Microsoft said.

“We’ve built App Center with some great features so far, but this is only the beginning. We look forward to building the future of App Center together,” it added.

The company acquired the startup behind HockeyApp back in 2014. HockeyApp

Wipro partners with Alfresco for open source digital transformation programme

Under a new partnership, Wipro and Alfresco will introduce a series of go-to-market initiatives, including a combined Predictive Service Automation solution using machine learning and artificial intelligence.

Wipro Digital, the digital business unit of Wipro Ltd, announced that it has expanded its global partnership with Alfresco, a leading enterprise open source provider of process automation, information governance software and content management.

The partnership between Wipro and Alfresco is aimed at creating, running and building open source based digital transformation programmes for clients all over the world, said the company in a statement.

The association will bring together the Digital Business Platform of Alfresco and the digital transformation expertise of Wipro. Under the terms of the partnership, the two firms will introduce a series of go-to-market initiatives, including a combined Predictive Service Automation solution using machine learning, artificial intelligence, and a framework based on microservices.

With these solutions, enterprises can eliminate asset failure, using the intelligence module that allows action from decades of data. The enterprises can also use augmented reality and virtual reality technologies to accelerate the incident resolution and cut down the costs on recruitment and training. In addition, third party associates can integrate their abilities through application programming interfaces (APIs).
