

```
p4 = histogram(x,y) # histograms
plot(p1,p2,p3,p4,layout=(2,2),legend=false)
```

PyPlot

In addition to the above mentioned visualisation libraries from Julia, you can also use the Matplotlib plotting library. For this purpose, you can use the PyCall package (which is used to call Python functions from the Julia language) to invoke the Matplotlib functions with negligible overheads.

Google Charts

Google Charts is the Julia interface to the Google Chart tools. Plotting with the Google Chart tool is similar to the other libraries specified in this article, with some minor changes. The major steps are listed below:

- Specify a Google data table
- Indicate the chart options
- Make a call to the function to make and draw the chart

A simple example is shown below [source: <https://juliaobserver.com/packages/GoogleCharts>]:

```
using GoogleCharts, DataFrames
scatter_data = DataFrame(
    Age = [8, 4, 11, 4, 3, 6.5],
    Weight = [12, 5.5, 14, 5, 3.5, 7 ]
)
options = Dict(:title => "Age vs. Weight comparison",
```

```
:hAxis => Dict(:title => "Age",
    :minValue => 0,
    :maxValue => 15),
:vAxis => Dict(:title => "Weight",
    :minValue => 0,
    :maxValue => 15)
)
scatter_chart(scatter_data, options)
```

The primary objective of this article is to introduce the various visualisation packages available in Julia. It can be inferred that because of the speed of the C programming language, Julia packages are ideal when you need to build production quality visualisations very fast. **END** 🐧
