

## DVD OF THE MONTH

Let security be the priority this month.

## Fedora 30 Security Lab

The Fedora Security Lab provides a safe test environment to work on security auditing, forensics, system rescue, and teaching security testing methodologies in universities and other organisations. It comes with the clean and fast Xfce desktop environment and a customised menu that provides all the instruments needed to follow a proper test path for security testing or to rescue a broken system. In the latest release of Fedora, the Cryptsetup metadata format has been changed to LUKS2 and there are changes in libcrypt too.

## Zorin OS 15 (Core)

Zorin OS is an Ubuntu based Linux distribution designed especially for newcomers to Linux. It has a Windows-like graphical user interface and many programs similar to those found in Windows. Zorin OS also comes with an application that lets users run many Windows programs. The latest release ships with Zorin Connect (based on KDE Connect) for sharing information between devices, improved performance and scheduled theme changes.

## Porteus 4.0 KDE and XFCE

For older computers that still use a 32-bit processor, we have bundled Porteus, a complete Linux operating system that is optimised to run from a CD, USB Flash drive, hard drive, or other bootable storage media. It's small (under 300MB) and extremely fast, which allows you to start up and get online, quickly.

## What is a live DVD?

A live CD/DVD or live disk contains a bootable operating system, the core program of any computer, which is designed to run all your programs and manage all your hardware and software.

Live CDs/DVDs have the ability to run a complete, modern OS on a computer even without secondary storage, such as a hard disk drive. The CD/DVD directly runs the OS and other applications from the DVD drive itself. Thus, a live disk allows you to try the OS before you install it, without erasing or installing anything on your current system. Such disks are used to demonstrate features or try out a release. They are also used for testing hardware functionality, before actual installation. To run a live DVD, you need to boot your computer using the disk in the ROM drive. To know how to set a boot device in BIOS, please refer to the hardware documentation for your computer/laptop.
