

Red Hat and Microsoft launch Azure Red Hat OpenShift to fuel hybrid cloud development

Red Hat and Microsoft recently launched Azure Red Hat OpenShift, which brings a jointly-managed enterprise-grade Kubernetes solution to Microsoft's leading public cloud, Microsoft Azure.

Azure Red Hat OpenShift provides an accelerated path towards hybrid cloud computing, enabling IT organisations to use Red Hat OpenShift Container Platform in their data centres, and seamlessly extend these workloads to use the power and scale of Azure services. Azure Red Hat OpenShift is the first jointly managed OpenShift offering in the public cloud.

Azure Red Hat OpenShift represents Red Hat and Microsoft's continued mutual commitment to provide a powerful, supported and more secure choice to develop and deploy hybrid cloud workloads, the companies said in a press release.

As its jointly supported by both companies, IT organisations can now have greater confidence in adopting hybrid cloud innovation that meets the requirements of mission-critical workloads in production, the partners added.

Paul Cormier, president, products and technologies, Red Hat, said, "The hybrid cloud provides a clear vision into the future of enterprise computing, where public cloud services stand alongside virtualisation, Linux containers and bare-metal servers. Together, this forms the new data centre in the hybrid cloud world. Azure Red Hat OpenShift provides a consistent Kubernetes foundation for enterprises to realise the benefits of this hybrid cloud model."

Azure Red Hat OpenShift combines the innovation of enterprise Kubernetes with one of the world's leading enterprise Linux platforms, Red Hat Enterprise Linux, running on the scale and power of Azure. Together, these technologies provide a powerful solution to more easily manage and orchestrate cloud-native workloads across a hybrid cloud environment.

With Azure Red Hat OpenShift, customers can also bring containerised applications into workflows where they exist, while mitigating many of the inherent complexities of container management.

Scott Guthrie, executive vice president, Cloud and AI Group, Microsoft, said, "Microsoft and Red Hat share a common goal of empowering enterprises to create a hybrid cloud environment that meets their current and future business needs. Azure Red Hat OpenShift combines the enterprise leadership of Azure with the power of Red Hat OpenShift to simplify container management on Kubernetes and help customers innovate on their cloud journeys."

Microsoft and Red Hat are also collaborating to bring customers containerised solutions with Red Hat Enterprise Linux 8 on Azure, Red Hat Ansible Engine 2.8 and Ansible certified modules. In addition, the two companies are working to deliver SQL Server 2019 with Red Hat Enterprise Linux 8 support and performance enhancements.

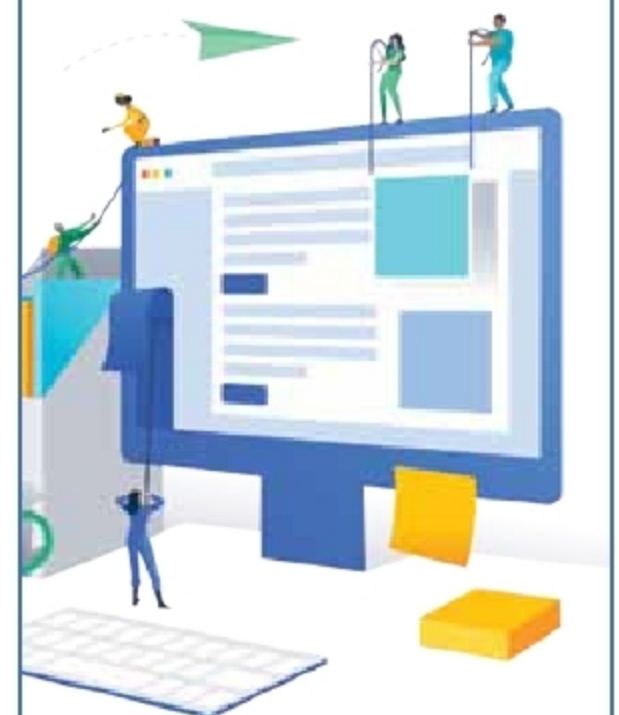

Azure Red Hat OpenShift is available now via Microsoft Azure.

SUSE launches new release of its software-defined storage solution

SUSE, a pioneer in open source software, has launched SUSE Enterprise Storage 6, the new release of its software-defined storage solution that is powered by Ceph technology.
