

Copay: Copay is an open source, secure, HD-multi-signature Bitcoin wallet, allowing end users (senders and receivers) to have complete control of the private keys required to access Bitcoin. It uses the Bitcoin Wallet Service (BWS) for peer synchronisation and network interfacing. The Copay app securely stores multiple, distinct Bitcoin wallets, allowing both business- and privacy-conscious users to keep funds carefully separated. It was created by BitPay Inc. and is maintained by BitPay along with hundreds of contributors.

Features:

- BIP32 hierarchical deterministic (HD) address generation and wallet backups.
- Payment protocol (BIP70-BIP73) support for payment requests and secure Bitcoin payments.
- BIP39 support for wallet backups.
- Push and email notifications for payments and transfers.
- Supports 150+ currency pricing options.
- Supports buying and selling Bitcoins and Amazon.com gift cards.
- Supports Trezor and Ledger Hardware Wallets.. Put “.” in front of the point, which is missing

Pros: Highly secure and private, supports multiple platforms and devices, and operates as a multi-signature wallet.

Cons: Only stores Bitcoin and Bitcoin Cash, and lacks two-factor authentication. Apps are sometimes slow and it has limited user support.

Jaxx: Jaxx is an open source, multi-cryptocurrency wallet supporting multiple coins including Bitcoin, Ether, Dash, Ether Classic, Litecoin, DAO, Zcash and others. It is available on multiple platforms (Windows, Linux, Chrome, Firefox, Android and iOS). With Jaxx’s 12-word Masterseed, users don’t have to worry about managing the private keys of their different blockchain assets. Jaxx doesn’t access the funds in any way, but with this key, users can easily recover their wallets if they lose access to the device they were on. Users can easily exchange currencies between Bitcoin, DAO and Ether through ShapeShift, using Jaxx. If you are looking for a multi-currency wallet, Jaxx is a perfect choice.

Features:

- Support for 65 currencies including cryptocurrencies and ERC20 tokens.
- Improved security model to protect sensitive information using AES-256 encryption enhanced by 5000 rounds of pbkdf2 password hashing.
- Hierarchical deterministic (HD) wallet support for safeguarding privacy rights.

- Easy to use in-person transaction using QR code.
- Pairs across devices — it easily syncs across devices (mobile, desktop, extension) by scanning a pairing token or inputting seed.
- Menu animations deliver stellar UI/UX.
- Provides three custom fee options – from low to high fees for faster transactions.

Pros: Multi-currency, good security, multiple platforms, user friendly, and easy exchange of cryptocurrencies.

Cons: Slow to load, backdoors in apps, and seed extraction vulnerability.

Armory: This is the first open source cold wallet for Bitcoin storage that has multi-signature support. The wallet has advanced security features with a simple intuitive dedicated interface for Bitcoin users looking for a safe storage option. Armory’s wallet software is based on the Python programming language. It is open source, which means it can be used as a platform for creating Bitcoin apps such as exchanges and crowdfunding platforms.

Armory provides cold storage support, so your private keys are stored offline, protecting them from any type of online attacks or hacks. Armory is also popular because it uses the Glacier Protocol, which is famous for being implemented in the most secure of cold storage systems for Bitcoins. The wallet is compatible with Windows, Mac OS X and Linux systems. The only cryptocurrency that the wallet supports is Bitcoin. The main advantage of Armory is that you can build a secure offline Bitcoin wallet. This lets you manage your wallet on a computer that is never connected to the Internet, making it a shut-tight system. All the private key data is kept only on the offline computer, significantly reducing the chances of hacking.

Features:

- Supports offline, cold storage wallets.
- Toggles between Standard, Advanced and Expert modes to allow different customisation options.
- Decentralised multi-signature lockboxes.

Pros: Top-end security features, such as hierarchical deterministic (HD) and multi-signature support, and cold storage support allowing users to manage Bitcoin without the Internet.

Cons: No mobile support, lack of two-factor authentication, and is not for beginners.
