

How the Tron, VET, NEO and Ethereum Blockchains Differ

The phenomenal rise in the value of Bitcoins was the trigger for the interest generated in blockchain technology. Developers keep coming up with new blockchain technologies at frequent intervals, and each is claimed as superior than the others. Here is a comparative study of the Tron, VET, NEO and Ethereum blockchains.

There are different types of cryptocurrencies available in the market, the underlying technology for which is the blockchain. The developers of each of these currencies claim that theirs is a better blockchain system. Many readers will already be aware of the Bitcoin and the Ethereum blockchains. Now we also have Tron, VET and the NEO blockchains. In this article, we will explore the differences between Tron, VET, NEO and the Ethereum blockchains.

The Tron blockchain

Tron uses a three-layered architecture — the application layer, storage layer and core layer. The Tron protocol follows Google's Protobuf and hence it supports multi-language extensions.

The Tron blockchain does not rely on Proof-of-Work (PoW) consensus, because this consumes more power and has a very low transaction speed (TPS). It uses a Proof-of-Stake (PoS) model as a consensus mechanism.

It uses KhaosDB and stores all new fork chains within a certain period of time, thus allowing witnesses to switch active fork chains into a new main chain.

Tron's digital token module consists of two parts:

1. The config module, which allows the customisation of digital tokens by users. This is achieved by using digital configuration functions.
2. The deployment module, which allows users to deploy a token or issue a token.

The cool feature of Tron is that it allows the creation of one's own contract, irrespective of the complexity. These contracts run on Tron virtual machines. Hence, the virtual machine platform itself helps the developers to create several different dApps.

For deployment into Tron virtual machines, the following are the prerequisites:

1. Oracle JDK 1.8 or later
2. Tron Studio
