

“The 3scale technology complements the Red Hat JBoss middleware portfolio, adding a robust and comprehensive set of API management capabilities to the existing rich integration features offered in today’s Red Hat JBoss Enterprise Application Platform (EAP), JBoss Fuse, JBoss A-MQ and the Red Hat Mobile Application Platform,” Piech wrote.

Keeping its promise, Red Hat has now released the 3scale code under the MIT and Apache Software License (ASL) v2, both of which are permissive and open source.

The company says it will continue its 3scale development efforts and come up with new features, new participation programmes and new ideas.

Newly created OpenHW Group aims to boost adoption of open source processors

Former executive director of the RISC-V Foundation, Rick O’Connor, has founded a new not-for-profit global organisation, which aims to boost the adoption of open source processors. The OpenHW Group encourages like-minded engineers to collaborate in the development of open source cores, related IP, tools and software such as the CORE-V family of cores.

The group intends to serve developers of processor cores and hardware, as well as software engineers who design System-on-Chips (SoCs) by providing a platform for collaboration, creating a focal point for ecosystem development and offering open source IP for processor cores.

“If you design or are looking for open source processor IP, the OpenHW Group is an organisation for collaborating with like-minded engineers. If you’re an SoC designer, you don’t have to design from scratch; we will help you accelerate your design process by supplying you with a growing range of proven processor IP options, all available within an expanding, high-quality ecosystem,” said O’Connor.

The group is introducing the CORE-V family of cores, which will support System-on-Chip (SoC) hardware and software designers with an assurance of quality and manufacturability when adopting RISC-V processor core IP.

The CORE-V family provides quality core IP in line with industry best practices. The IP is available in both silicon and FPGA optimised implementations. These cores can be used to facilitate rapid design innovation and ensure effective manufacturability of high-volume production SoCs.

The OpenHW Group has already recruited 13 sponsor organisations and expects this number to grow to 25 by the end of 2019. Inaugural OpenHW sponsors include Alibaba, Bluespec, CMC Microsystems, Embecosm, ETH

Zurich (University), GreenWaves, Imperas, Metrics, Mythic AI, NXP, Onespun, Silicon Labs and Thales.

The organisation, which is a member of the RISC-V Foundation, has also entered into a strategic partnership with the Eclipse Foundation, a global community for open source software collaboration and innovation.
