

DVD OF THE MONTH

Powerful and reliable open source operating systems and a Linux distribution for developers.

Fedora 30 Workstation

Fedora Workstation is a reliable, user-friendly, and powerful operating system for your laptop or desktop computer. It supports a wide range of developers — from hobbyists and students to professionals in corporate environments. The latest edition includes GNOME 3.32 as the desktop environment, which features an updated visual style, including the user interface, the icons, and the desktop itself. The latest that the open source world has to offer — GCC 9, Bash 5.0 and PHP 7.3 — are among the many updated packages in Fedora 30. The ISO image for the 64-bit live edition can be found on the DVD under the *other_isos* folder.

Fedora 30 Silverblue

Fedora Silverblue is an immutable desktop operating system. It is designed to be extremely stable and reliable. The aim is for it to be an excellent platform for developers and for those using container-focused workflows. The ISO image for the 64-bit live edition can be found on the DVD under the *other_isos* folder.

Puppy Linux 8.0 – ‘BionicPup’

Puppy Linux is a unique family of Linux distributions meant for home computers. It was originally created by Barry Kauler in 2003. BionicPup is the latest release and has been bundled with this month’s OSFY DVD. You can boot your system into the live 64-bit OS using the disk.

What is a live DVD?

A live CD/DVD or live disk contains a bootable operating system, the core program of any computer, which is designed to run all your programs and manage all your hardware and software.

Live CDs/DVDs have the ability to run a complete, modern OS on a computer even without secondary storage, such as a hard disk drive. The CD/DVD directly runs the OS and other applications from the DVD drive itself. Thus, a live disk allows you to try the OS before you install it, without erasing or installing anything on your current system. Such disks are used to demonstrate features or try out a release. They are also used for testing hardware functionality, before actual installation. To run a live DVD, you need to boot your computer using the disk in the ROM drive. To learn how to set a boot device in BIOS, please refer to the hardware documentation for your computer/laptop.
