

HiveMQ makes it easy to move data to and from connected IoT devices and enterprise systems in an efficient, fast and reliable manner, the company said on its website.

According to the developers, HiveMQ was built to address some of the key technical challenges that organisations face when building new IoT applications.

Dominik said that they will continue to sell commercial editions of HiveMQ, HiveMQ Professional and HiveMQ Enterprise. He said, “Our customers are deploying business critical applications using HiveMQ and MQTT; so they require features that are beyond the MQTT specification. Our commercial editions will include features such as the HiveMQ Control Center for monitoring and logging, elastic clustering for scalability and high availability, enterprise extensions such as our new HiveMQ Enterprise Extension for Kafka, and features required for use in complex corporate environments.”

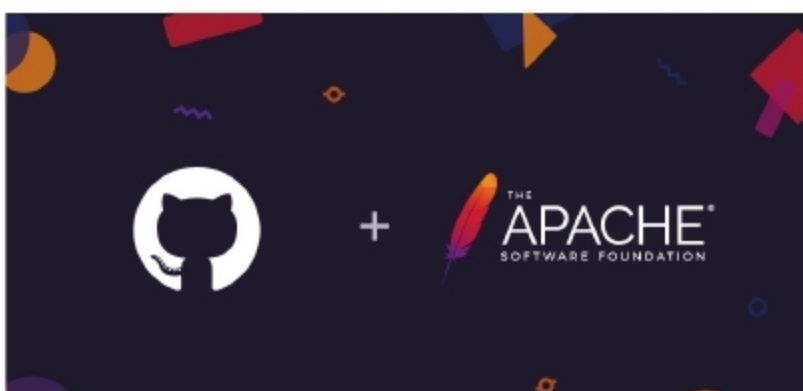

As the core of their commercial products will be the open source HiveMQ Community Edition, Dominik noted that their customers will benefit from the new open source community.

Apache Software Foundation joins GitHub, expands infrastructure support

The Apache Software Foundation (ASF) has completed its infrastructure support expansion by migrating its Git service to GitHub, the Microsoft-owned code management platform. The move would allow the ASF community to make full use of GitHub’s tools.

Before integrating with GitHub, Apache projects had two version control services available via ASF Infrastructure: Apache Subversion and Git. Over the years, an increasing number of projects and their communities wanted to make their code available on GitHub as well. But as they could only host read-only mirrors on GitHub, the ability to use GitHub’s tools around those repositories was limited, the Foundation explained.

In 2016, Apache started integrating GitHub’s repository and tooling with its own services. By February 2019, the foundation was able to successfully move all Git projects to GitHub, enabling all these projects to be hosted on a simple platform so that their developer could review, collaborate and build software alongside 31 million other developers around the world who use GitHub.

“Over time, we improved, debugged and solidified this integration. In late 2018, we asked all projects to move away from our internal Git service to that provided by GitHub. This shift brought all of their tooling to our projects, while we maintain a backup mirror on our infrastructure,” said Greg Stein, ASF infrastructure administrator, in an official statement.

After completing the migration to GitHub, the ASF decommissioned its Git service in February 2019. GitHub director of products, Bryan Clarke, wrote in a blog post, “We’re grateful to have such an impactful foundation migrate and grow directly on GitHub. With this transition completed, Apache can focus on building software and its community.”

“Whether we’re working with individual open source maintainers and contributors or some of the world’s largest open source foundations like Apache, GitHub’s mission is to be the home for all developers by supporting open source communities, addressing their unique needs, and helping open source projects thrive,” Clarke added.

Apache Software Foundation announces NetBeans as Top-Level Project

The Apache Software Foundation (ASF) has announced the Apache NetBeans as a Top-Level Project (TLP). Apache NetBeans is an open source development environment, tooling platform and application framework that enables Java programmers to build desktop, mobile and Web applications. Originally developed as part of a student project in 1996, NetBeans was acquired and open sourced by Sun Microsystems in 2000. It became part of Oracle when the company acquired Sun Microsystems in 2010.

NetBeans was submitted to the Apache Incubator in October 2016. The Apache Incubator is the entry path for projects and code bases wishing to become part of the efforts at the Apache Software Foundation.

Being considered a Top-Level Project will help improve NetBeans’ visibility and help it gain more traction when it comes to usage and contributions. “Being part of the ASF means that NetBeans is now not only free and open source software; it is also, uniquely, and for the first time, part of a foundation specifically focused on enabling open governance,” said Geertjan Wielenga, VP, Apache NetBeans.

“Every contributor to the project now has an equal say over the roadmap and direction of NetBeans. That is a new and historic step and the community has been ready for this for a very long time,” Wielenga added. Apache NetBeans 11.0 was released on April 4, 2019. It is the project’s third major release since entering the Apache Incubator. Apache NetBeans software is released under the Apache License v2.0.
