

Microsoft, Red Hat collaborate to launch the Kubernetes event-driven autoscaling tool

Microsoft and Red Hat have jointly developed and open-sourced the Kubernetes event-driven autoscaling (KEDA) service. According to sources at Microsoft, KEDA enables developers to deploy serverless containers on Kubernetes in any public or private cloud, as well as on-premises, including Microsoft's Azure Kubernetes Service (AKS) and Red Hat Open Shift.

The service allows a container to consume events directly from the source, instead of routing through HTTP. This means any Kubernetes workload requiring scaling based on events rather than CPU or memory scaling, can use the service.

In the coming months, Microsoft plans to open source its Q# compiler and quantum simulators, which are part of the Quantum Development Kit in GitHub. In addition, it is bringing Azure Active Directory synchronisation to GitHub users. This capability was made available for public preview on May 23 this year.

Microsoft is also releasing the open-sourced version 1.0 of ML.NET, which enables developers to create models that use machine learning tasks.

As the world's largest open source foundation, the ASF's 200 million+ lines of code are overseen by an all-volunteer community of 730 individual ASF members and 7,000 Apache code committers. Over its 20-year history, 1,058,321,099 lines of code have been committed across 3,022,836 code commits.

Oman launches capacity-building programme in FOSS

The Oman Information Technology Authority (ITA) and the College of Engineering at Sultan Qaboos University (SQU) have jointly launched a new capacity-building programme to sharpen the skills of students and professionals in free and open source software (FOSS) technologies.

The newly launched 'Oman Free and Open Source Software Platform' is an initiative involving a number of FOSS capacity-building programmes organised by SQU and ITA. Through this platform, the organisers seek to promote awareness, training, consultation and technical support in free and open source software in the country.

The agenda of this new initiative includes awareness on free and open source software history, concepts, business models and local initiatives; specialised training in different free and open source software technologies; free and open source software consultation for government and private organisations; and technical support on different free and open source technologies.

Red Hat launches Red Hat Enterprise Linux 8

Red Hat, the world's leading provider of open source solutions, has announced the general availability of Red Hat Enterprise Linux 8, the operating system designed to span the breadth of deployments across enterprise IT.

For any workload running on any environment, Red Hat Enterprise Linux 8 delivers one enterprise Linux experience to meet the unique technology needs of evolving enterprises. From deploying new Linux workloads into production to launching digital transformation strategies, the next-generation enterprise is built on top of the world's leading enterprise Linux platform.

According to the company, Red Hat Enterprise Linux (RHEL) 8 is the operating system redesigned for the hybrid cloud era, and it is built to support the workloads and operations that stretch from enterprise data centres to multiple public clouds.

RHEL 8 is built to not just support enterprise IT in the hybrid cloud, but to help new technology strategies thrive. As data centres grow in scale and scope and workload complexity builds up, the skills required to deploy and maintain Linux-based production systems become increasingly critical.

Thanks to the announcement of RHEL 8, this intelligence and expertise is now built-in to RHEL subscriptions by default with Red Hat Insights delivering Red Hat's Linux expertise as-a-service.

In addition, RHEL 8 introduces Application Streams. Fast-moving languages, frameworks and developer tools are updated frequently in this stream without impacting the core resources that have made RHEL an enterprise benchmark. This blends faster developer innovation with production stability in a single, enterprise-class operating system.

Paul Cormier, president, products and technologies, Red Hat, commented, "Over the past two decades, we've seen Linux grow from a niche operating system to the default option for enterprise data centres. RHEL has been at the forefront of this evolution, supporting nearly every workload and enterprise IT environment that our partners and customers can conceive. Red Hat Enterprise Linux 8 continues this work but delivers more than just production-ready Linux; it provides a catalyst for innovation at cloud-scale."

According to the company, RHEL 8 is designed to lower the barrier to entry for Linux, enabling greater accessibility for Windows administrators, Linux beginners
