

- Conduct systems tests for security, performance and availability
- Develop and maintain design and troubleshooting documentation

Build/release engineer: The build engineer is responsible for ensuring that build and deployment requirements are met in a fast-paced CI/CD environment.

Roles and responsibilities

- Manage and maintain code, create new builds, standardise automated deployment, ensure the satisfaction of configuration requirements, assist with release notes and more
- Understand the importance of user expectations and perhaps take on some of the hybrid responsibilities of a UX designer role

The release manager: This person needs to interface and communicate with test managers, Dev managers, IT Ops and, of course, the PMO (Project Management Office) on a daily basis. Equally, a release manager must be confident enough to manage and report to the senior IT management like the CIO and CTO, as well as to business management.

Roles and responsibilities

- Manage the release life cycle, which includes scheduling, coordinating and the management of releases across the enterprise for multiple applications across various portfolios
- Build the IT release calendar working closely with the IT release managers from different portfolios across IT, and centralise the view of all releases
- Manage risks and resolve issues that affect the release's scope, schedule and quality
- Measure and monitor the progress of the release to ensure application releases are delivered on time and within budget and that they meet or exceed expectations
- Coordinate release content and efforts based on the service request backlog, pending service requests, third party applications or operating system updates
- Communicate all key project plans, commitments and changes including requirements, QA plans, schedules and scope changes
- Manage relationships and coordinate work between different teams at different locations
- Conduct release readiness reviews, milestone reviews and business go/no-go reviews
- Produce deployment, run books and implementation plans
- Maintain the release schedule for all core services and ensure alignment across key partners and vendors
- Develop scripts and automation tools to be used to build, integrate and deploy software releases to various platforms

- Research new software development and configuration management methodologies and technologies, and analyse their application to current configuration management needs

Site reliability engineer: The site reliability engineer, or the reliability engineer, is responsible for ensuring the quality of orchestration and the integration of tools needed to support daily operations. This role is important in any DevOps organisation, as a failure to ensure sound integration can lead to outages that are costly.

Roles and responsibilities

- Create a bridge between development and operations by applying a software engineering mindset to systems administration tasks
- Collaborate closely with product developers to ensure that the designed solution responds to non-functional requirements such as availability, performance, security and maintainability
- Work with release engineers to ensure that the software delivery pipeline is as efficient as possible
- Be responsible for the availability, performance, monitoring and for incident response, among other things, of the platforms and services that the company runs and owns

Data analyst: A data analyst's responsibilities include conducting the full life cycle analysis to include requirements, activities and design. Data analysts develop analysis and reporting capabilities. They will also monitor performance and quality control plans to identify improvements.

Roles and responsibilities

- Interpret data, analyse results using statistical techniques and provide ongoing reports
- Develop and implement databases, data collection systems, data analytics and other strategies that optimise statistical efficiency and quality
- Acquire data from primary or secondary data sources and maintain databases/data systems
- Identify, analyse and interpret trends or patterns in complex data sets
- Filter and clean data by reviewing computer reports, printouts and performance indicators to locate and correct code problems
- Work with management to prioritise business and information needs
- Locate and define new process improvement opportunities

Product manager: This person is responsible for collaborating with the Dev team to ensure the product's requirements are met to a high-quality standard at each sprint. Product managers provide the deep product expertise needed to lead the organisation and make strategic product decisions.
