

- and Verify; Create and Deliver)
- DASA Leadership (Product Owner; DevOps Leader; DevOps Coach)
Skills validated in the different certifications are:
- The DASA DevOps Fundamentals certification provides an extensive introduction to the core Agile DevOps principles covering the essential knowledge and skill competencies that have been defined by DASA.
- The DASA DevOps Professional Enable and Scale certification validates that the candidate has a practical understanding and experience in leading DevOps teams and enables members to become effective, ensuring the team works optimally.
- The DASA DevOps Professional Specify and Verify certification focuses on ensuring that the requirements of the customers are fully understood and brought into the team so that these can be integrated into the IT product or service being delivered by the team.
- The DASA DevOps Professional Create and Deliver certification addresses the heart of a DevOps team, as it focuses on programming, continuous delivery, security, risk and compliance as well as

infrastructure engineering.

- The DASA DevOps Product Owner certification helps the product owner realise the maximum business value and engage with stakeholders; it deals with future requirements as well as operational challenges.
- The DASA DevOps Leader certification program helps leaders understand leadership in the context of DevOps, discusses leadership development models, building teams and transforming the organisation.
- The DevOps Coach certification helps team members and other stakeholders in the organisation apply DevOps concepts and principles within their organisation.

Infrastructure knowledge: In order to know the system in-depth and understand each bit of the work being done, having the right infrastructure knowledge will enable a DevOps engineer to design and deploy applications effectively using the best possible platforms.

What are some typical DevOps engineer interview questions?

In a job interview for a DevOps engineer position, candidates can expect to get questions such as:

1. What is your favoured development life cycle? Describe its pros and cons, as well as the actors and tooling involved.
2. What DevOps tools do you use, and why?
3. What are your best practices for making a DevOps process work?

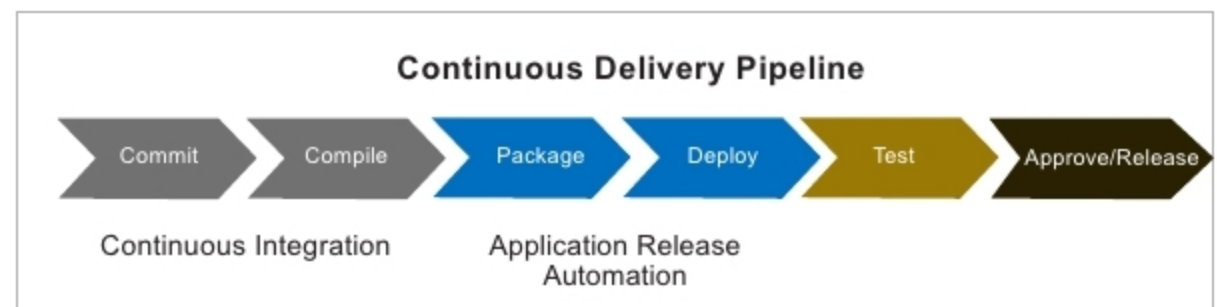

Figure 4: The DevOps continuous delivery pipeline

4. How do you keep on top of the latest tech, and what process do you follow to identify what you need when the shelf tools aren't enough?
5. What would you rank as your top three technical skills?
6. How do you motivate developers to

follow best practices?

7. How do you adapt when things don't go as planned?

These questions, along with more specific technical ones, aim to gauge the candidate's understanding of processes and tools. **END**
